After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
Your network contains an Active Directory domain. You deploy an Azure AD tenant.
Another administrator configures the domain to synchronize to Azure AD.
You discover that 10 user accounts in an organizational unit (OU) are NOT synchronized to Azure AD. All the other user accounts synchronized successfully.
You review Azure AD Connect Health and discover that all the user account synchronizations completed successfully.
You need to ensure that the 10 user accounts are synchronized to Azure AD. Solution: You run idfix.exe and export the 10 user accounts.

How is Azure AD Connect cloud sync different from Azure AD Connect sync?
With Azure AD Connect cloud sync, provisioning from AD to Azure AD is orchestrated in Microsoft Online Services. An organization only needs to deploy, in their on-premises or IaaS-hosted environment, a
light-weight agent that acts as a bridge between Azure AD and AD. The provisioning configuration is stored in Azure AD and managed as part of the service.

Cloud provisioning agent requirements include:
* An on-premises server for the provisioning agent with Windows 2016 or later.
This server should be a tier 0 server based on the Active Directory administrative tier model. Installing the agent on a domain controller is supported.
Note: Windows Server Core is a minimal installation option for the Windows Server operating system (OS) that has no GUI and only includes the components required to perform server roles and run applications.

NEW QUESTION 68
- (Exam Topic 5)
Your on-premises network contains an Active Directory domain. You have a Microsoft 365 subscription.
You need to sync the domain with the subscription. The solution must meet the following requirements: On-premises Active Directory password complexity policies must be enforced.
Users must be able to use self-service password reset (SSPR) in Azure AD.
What should you use?

A. password hash synchronization
B. Azure AD Identity Protection
C. Azure AD Seamless Single Sign-On (Azure AD Seamless SSO)
D. pass-through authentication

Answer: D

Explanation:
Azure Active Directory (Azure AD) Pass-through Authentication allows your users to sign in to both on-premises and cloud-based applications using the same passwords.
This feature is an alternative to Azure AD Password Hash Synchronization, which provides the same benefit of cloud authentication to organizations. However, certain organizations wanting to enforce their on-premises Active Directory security and password policies, can choose to use Pass-through Authentication instead.
Note: Azure Active Directory (Azure AD) self-service password reset (SSPR) lets users reset their passwords in the cloud, but most companies also have an on-premises Active Directory Domain Services (AD DS) environment for users. Password writeback allows password changes in the cloud to be written back to an on-premises directory in real time by using either Azure AD Connect or Azure AD Connect cloud sync. When users change or reset their passwords using SSPR in the cloud, the updated passwords also written back to the on-premises AD DS environment.
Password writeback is supported in environments that use the following hybrid identity models: Password hash synchronization
Pass-through authentication
Active Directory Federation Services Reference:

Your network contains an Active Directory domain. You deploy an Azure AD tenant.
Another administrator configures the domain to synchronize to Azure AD.
You discover that 10 user accounts in an organizational unit (OU) are NOT synchronized to Azure AD. All the other user accounts synchronized successfully.
You review Azure AD Connect Health and discover that all the user account synchronizations completed successfully.
You need to ensure that the 10 user accounts are synchronized to Azure AD. Solution: From Azure AD Connect, you modify the Azure AD credentials. Does this meet the goal?

A. Yes
B. No

Answer: B

Explanation:
The question states that “all the user account synchronizations completed successfully”. Therefore, the Azure AD credentials are configured correctly in Azure AD Connect. It is likely that the 10 user accounts are being excluded from the synchronization cycle by a filtering rule.

Your network contains an on-premises Active Directory domain named contoso.com. The domain contains the objects shown in the following table.

Name	Configuration
Group1	Global security group
User1	Enabled user account
User2	Disabled user account

You configure Azure AD Connect to sync contoso.com to Azure AD. Which objects will sync to Azure AD?

A. Group1 only
B. User1 and User2 only
C. Group1 and User1 only
D. Group1, User1, and User2

Answer: D

Explanation:

Disabled accounts
Disabled accounts are synchronized as well to Azure AD. Disabled accounts are common to represent resources in Exchange, for example conference rooms. The exception is users with a linked mailbox; as previously mentioned, these will never provision an account to Azure AD.
The assumption is that if a disabled user account is found, then we won't find another active account later and the object is provisioned to Azure AD with the userPrincipalName and sourceAnchor found. In case another active account will join to the same metaverse object, then its userPrincipalName and sourceAnchor will be used.

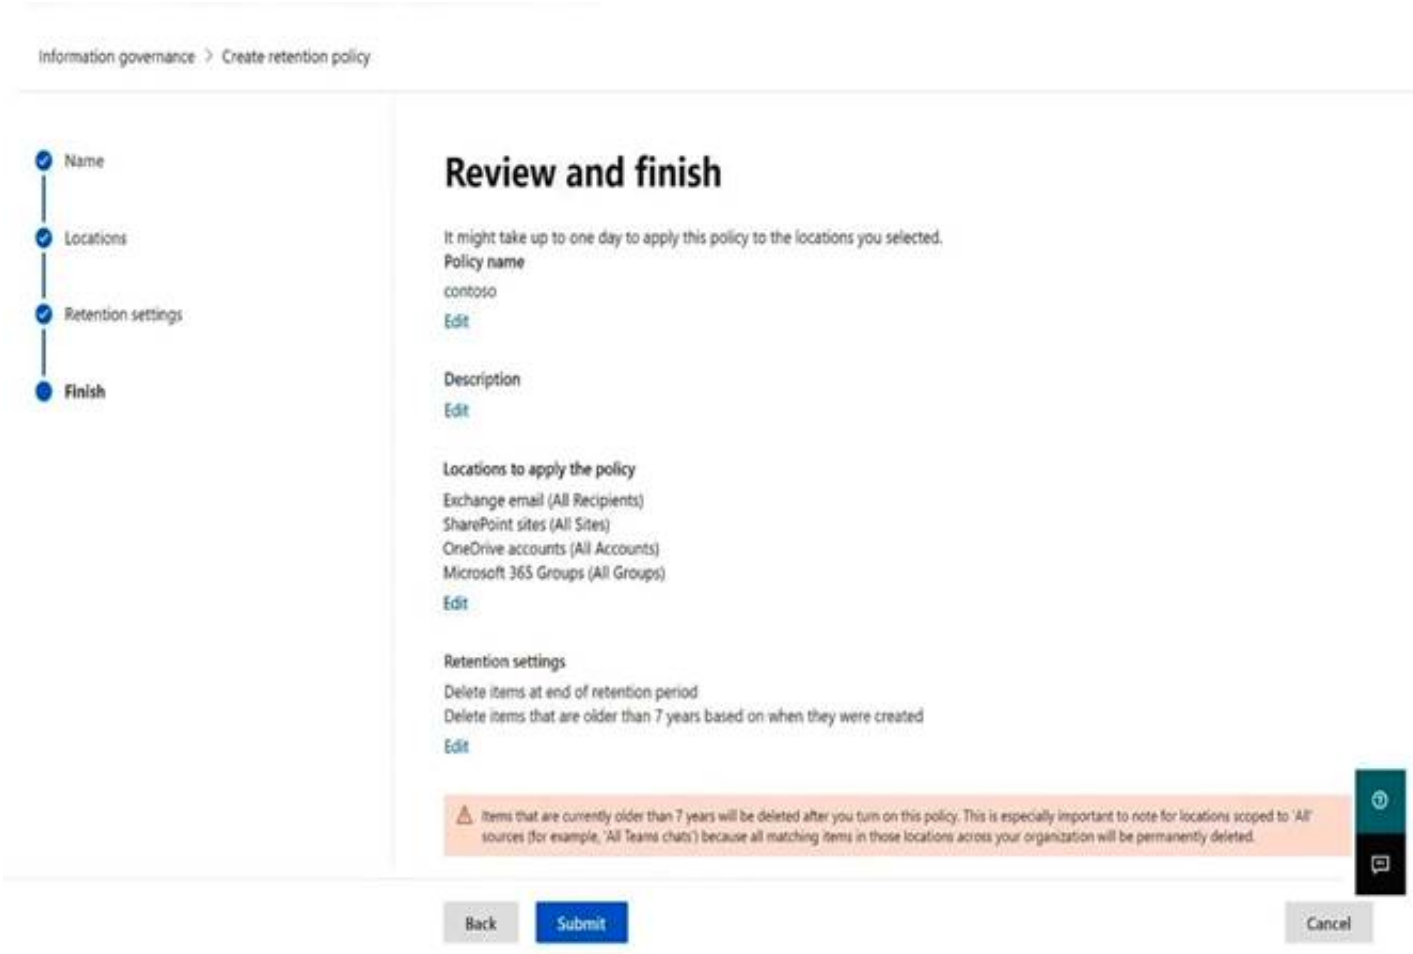
NEW QUESTION 133
- (Exam Topic 5)
HOTSPOT
You have a Microsoft 365 tenant.
You plan to create a retention policy as shown in the following exhibit.



Use the drop-down menus to select the answer choice that completes each statement based on the information presented in the graphic.
NOTE: Each correct selection is worth one point.

Answer Area

Microsoft SharePoint files that are affected by the policy will be **[answer choice]**.
- recoverable for up to seven years
- deleted seven years after they were created
- retained for only seven years from when they were created

Once the policy is created, **[answer choice]**.
- some data may be deleted immediately
- data will be retained for a minimum of seven years
- users will be prevented from permanently deleting email messages for seven years

A. Mastered
B. Not Mastered

Answer: A

Explanation:
Box 1: Deleted seven years after they were created. From the exhibit:
The retention policy applies to SharePoint sites.
Delete items that are older than 7 years based on when they were created. Box 2: data will retained for a minimum of seven years
The longest retention period wins. If content is subject to multiple retention settings that retain content for different periods of time, the content will be retained until the end of the longest retention period for the item.
Note: Use a retention policy to assign the same retention settings for content at a site or mailbox level, and use a retention label to assign retention settings at an item level (folder, document, email).
For example, if all documents in a SharePoint site should be retained for 5 years, it's more efficient to do this with a retention policy than apply the same retention label to all documents in that site. However, if some documents in that site should be retained for 5 years and others retained for 10 years, a retention policy wouldn't be able to do this. When you need to specify retention settings at the item level, use retention labels.

HOTSPOT
You have a Microsoft 365 E5 subscription.
All company-owned Windows 11 devices are onboarded to Microsoft Defender for Endpoint. You need to configure Defender for Endpoint to meet the following requirements:
- Block a vulnerable app until the app is updated.
- Block an application executable based on a file hash. The solution must minimize administrative effort.

B. Not Mastered

Answer: A

Explanation:
Box 1: A remediation request
Block a vulnerable app until the app is updated. Block vulnerable applications
How to block vulnerable applications
- Go to Vulnerability management > Recommendations in the Microsoft 365 Defender portal.
- Select a security recommendation to see a flyout with more information.
- Select Request remediation.
- Select whether you want to apply the remediation and mitigation to all device groups or only a few.
- Select the remediation options on the Remediation request page. The remediation options are software update, software uninstall, and attention required.
- Pick a Remediation due date and select Next.
- Under Mitigation action, select Block or Warn. Once you submit a mitigation action, it is immediately applied.
- Review the selections you made and Submit request. On the final page you can choose to go directly to the remediation page to view the progress of remediation activities and see the list of blocked applications.

Box 2: A file indicator
Block an application executable based on a file hash.
While taking the remediation steps suggested by a security recommendation, security admins with the proper permissions can perform a mitigation action and block vulnerable versions of an application. File indicators of compromise (IOC)s are created for each of the executable files that belong to vulnerable versions of that application. Microsoft Defender Antivirus then enforces blocks on the devices that are in the specified scope.
The option to View details of blocked versions in the Indicator page brings you to the Settings > Endpoints > Indicators page where you can view the file hashes and response actions.

B. Not Mastered

Answer: A

Explanation:
Box 1: Only T4il$pin45dg4
Box 2: can attempt to sign in immediately Note: Manage Azure AD smart lockout values
Based on your organizational requirements, you can customize the Azure AD smart lockout values. Customization of the smart lockout settings, with values specific to your organization, requires Azure AD Premium P1 or higher licenses for your users. Customization of the smart lockout settings is not available for Azure China 21Vianet tenants.
To check or modify the smart lockout values for your organization, complete the following steps:
- Sign in to the Entra portal.
- Search for and select Azure Active Directory, then select Security > Authentication methods > Password protection.
- Set the Lockout threshold, based on how many failed sign-ins are allowed on an account before its first lockout.
- The default is 10 for Azure Public tenants and 3 for Azure US Government tenants.
- Set the Lockout duration in seconds, to the length in seconds of each lockout.
- The default is 60 seconds (one minute).

If the first sign-in after a lockout period has expired also fails, the account locks out again. If an account locks repeatedly, the lockout duration increases.

NEW QUESTION 221
- (Exam Topic 5)
You have a Microsoft 365 E5 subscription that contains the following user:
- Name: User1
- UPN: user1@contoso.com
- Email address: user1@marketmg.contoso.com
- MFA enrollment status: Disabled

When User1 attempts to sign in to Outlook on the web by using the user1@marketing.contoso.com email address, the user cannot sign in.
You need to ensure that User1 can sign in to Outlook on the web by using user1@marketing.contoso.com. What should you do?

A. Assign an MFA registration policy to User1.
B. Reset the password of User1.
C. Add an alternate email address for User1.
D. Modify the UPN of User1.

Answer: D

Explanation:
Microsoft's recommended best practices are to match UPN to primary SMTP address. This article addresses the small percentage of customers that cannot remediate UPN's to match.
Note: A UPN is an Internet-style login name for a user based on the Internet standard RFC 822. The UPN is shorter than a distinguished name and easier to remember. By convention, this should map to the user's email name. The point of the UPN is to consolidate the email and logon namespaces so that the user only needs to remember a single name.
Configure the Azure AD multifactor authentication registration policy
Azure Active Directory (Azure AD) Identity Protection helps you manage the roll-out of Azure AD multifactor authentication (MFA) registration by configuring a Conditional Access policy to require MFA registration no matter what modern authentication app you're signing in to.

HOTSPOT
You have a Microsoft 365 subscription.
You deploy the anti-phishing policy shown in the following exhibit.
Use the drop-down menus to select the answer choice that completes each statement based on the information presented in the graphic.
NOTE: Each correct selection is worth one point.

Answer Area

To ensure that malicious email impersonating the CEO of a partner company is blocked, you must modify the **[answer choice]** setting.

- Add trusted senders and domains
- Enable domains to protect
- Enable users to protect
- Phishing email threshold

To minimize disrupting users that frequently exchange legitimate email with the CEO of a partner company, you must configure the **[answer choice]** setting.

- Add trusted senders and domains
- Enable intelligence for impersonation protection
- Enable spoof intelligence

A. Mastered
B. Not Mastered

Answer: A

Explanation:
Box 1: Enable users to protect
Anti-phishing policies in Defender for Office 365 also have impersonation settings where you can specify individual sender email addresses or sender domains that will receive impersonation protection.
User impersonation protection
User impersonation protection prevents specific internal or external email addresses from being impersonated as message senders. For example, you receive an email message from the Vice President of your company asking you to send her some internal company information. Would you do it? Many people would send the reply without thinking.
You can use protected users to add internal and external sender email addresses to protect from impersonation. This list of senders that are protected from user impersonation is different from the list of recipients that the policy applies to (all recipients for the default policy; specific recipients as configured in the Users, groups, and domains setting in the Common policy settings section).
When you add internal or external email addresses to the Users to protect list, messages from those senders are subject to impersonation protection checks. The message is checked for impersonation if the message is sent to a recipient that the policy applies to (all recipients for the default policy; Users, groups, and domains recipients in custom policies). If impersonation is detected in the sender's email address, the action for impersonated users is applied to the message.
Box 2: Add trusted senders and domains Trusted senders and domains
Trusted senders and domain are exceptions to the impersonation protection settings. Messages from the specified senders and sender domains are never classified as impersonation-based attacks by the policy. In other words, the action for protected senders, protected domains, or mailbox intelligence protection aren't applied to these trusted senders or sender domains. The maximum limit for these lists is 1024 entries.
