

CompTIA

Exam Questions CAS-005

CompTIA SecurityX Exam

NEW QUESTION 1

A company's help desk is experiencing a large number of calls from the finance department slating access issues to www.bank.com The security operations center reviewed the following security logs:

User	User IP & Subnet	Location	Website	DNS Resolved IP (public)	HTTP Status Code
User12	10.200.2.52/24	Finance	www.bank.com	65.146.76.34	495
User31	10.200.2.213/24	Finance	www.bank.com	65.146.76.34	495
User46	10.200.5.76/24	IT	www.bank.com	98.17.62.78	200
User23	10.200.2.156/24	Finance	www.bank.com	65.146.76.34	495
User51	10.200.4.138/24	Legal	www.bank.com	98.17.62.78	200

Which of the following is most likely the cause of the issue?

- A. Recursive DNS resolution is failing
- B. The DNS record has been poisoned.
- C. DNS traffic is being sinkholed.
- D. The DNS was set up incorrectly.

Answer: C

Explanation:

Sinkholing, or DNS sinkholing, is a method used to redirect malicious traffic to a safe destination. This technique is often employed by security teams to prevent access to malicious domains by substituting a benign destination IP address.

In the given logs, users from the finance department are accessing www.bank.com and receiving HTTP status code 495. This status code is typically indicative of a client certificate error, which can occur if the DNS traffic is being manipulated or redirected incorrectly. The consistency in receiving the same HTTP status code across different users suggests a systematic issue rather than an isolated incident.

? Recursive DNS resolution failure (A) would generally lead to inability to resolve DNS at all, not to a specific HTTP error.

? DNS poisoning (B) could result in users being directed to malicious sites, but again, would likely result in a different set of errors or unusual activity.

? Incorrect DNS setup (D) would likely cause broader resolution issues rather than targeted errors like the one seen here.

By reviewing the provided data, it is evident that the DNS traffic for www.bank.com is being rerouted improperly, resulting in consistent HTTP 495 errors for the finance department users. Hence, the most likely cause is that the DNS traffic is being sinkholed.

? CompTIA SecurityX study materials on DNS security mechanisms.

? Standard HTTP status codes and their implications.

NEW QUESTION 2

A company is having issues with its vulnerability management program New devices/IPs are added and dropped regularly, making the vulnerability report inconsistent Which of the following actions should the company take to most likely improve the vulnerability management process?

- A. Request a weekly report with all new assets deployed and decommissioned
- B. Extend the DHCP lease time to allow the devices to remain with the same address for a longer period.
- C. Implement a shadow IT detection process to avoid rogue devices on the network
- D. Perform regular discovery scanning throughout the IT landscape using the vulnerability management tool

Answer: D

Explanation:

To improve the vulnerability management process in an environment where new devices/IPs are added and dropped regularly, the company should perform regular discovery scanning throughout the IT landscape using the vulnerability management tool. Here's why:

? Accurate Asset Inventory: Regular discovery scans help maintain an up-to-date inventory of all assets, ensuring that the vulnerability management process includes all relevant devices and IPs.

? Consistency in Reporting: By continuously discovering and scanning new and existing assets, the company can generate consistent and comprehensive vulnerability reports that reflect the current state of the network.

? Proactive Management: Regular scans enable the organization to proactively identify and address vulnerabilities on new and existing assets, reducing the window of exposure to potential threats.

? References:

NEW QUESTION 3

After some employees were caught uploading data to online personal storage accounts, a company becomes concerned about data leaks related to sensitive, internal documentation. Which of the following would the company most likely do to decrease this type of risk?

- A. Improve firewall rules to avoid access to those platforms.
- B. Implement a cloud-access security broker
- C. Create SIEM rules to raise alerts for access to those platforms
- D. Deploy an internet proxy that filters certain domains

Answer: B

Explanation:

A Cloud Access Security Broker (CASB) is a security policy enforcement point placed between cloud service consumers and cloud service providers to combine and interject enterprise security policies as cloud-based resources are accessed. Implementing a CASB provides several benefits:

? A. Improve firewall rules to avoid access to those platforms: This can help but is not as effective or comprehensive as a CASB.

? B. Implement a cloud-access security broker: A CASB can provide visibility into cloud application usage, enforce data security policies, and protect against data

leaks by monitoring and controlling access to cloud services. It also provides advanced features like data encryption, data loss prevention (DLP), and compliance monitoring.

? C. Create SIEM rules to raise alerts for access to those platforms: This helps in monitoring but does not prevent data leaks.

? D. Deploy an internet proxy that filters certain domains: This can block access to specific sites but lacks the granular control and visibility provided by a CASB. Implementing a CASB is the most comprehensive solution to decrease the risk of data leaks by providing visibility, control, and enforcement of security policies for cloud services. References:

? CompTIA Security+ Study Guide

? NIST SP 800-144, "Guidelines on Security and Privacy in Public Cloud Computing"

NEW QUESTION 4

A security analyst discovered requests associated with IP addresses known for born legitimate 3rd bot-related traffic. Which of the following should the analyst use to determine whether the requests are malicious?

- A. User-agent string
- B. Byte length of the request
- C. Web application headers
- D. HTML encoding field

Answer: A

Explanation:

The user-agent string can provide valuable information to distinguish between legitimate and bot-related traffic. It contains details about the browser, device, and sometimes the operating system of the client making the request.

Why Use User-Agent String?

? Identify Patterns: User-agent strings can help identify patterns that are typical of bots or legitimate users.

? Block Malicious Bots: Many bots use known user-agent strings, and identifying these can help block malicious requests.

? Anomalies Detection: Anomalous user-agent strings can indicate spoofing attempts or malicious activity.

Other options provide useful information but may not be as effective for initial determination of the nature of the request:

? B. Byte length of the request: This can indicate anomalies but does not provide detailed information about the client.

? C. Web application headers: While useful, they may not provide enough distinction between legitimate and bot traffic.

? D. HTML encoding field: This is not typically used for identifying the nature of the request.

References:

? CompTIA SecurityX Study Guide

? "User-Agent Analysis for Security," OWASP

? NIST Special Publication 800-94, "Guide to Intrusion Detection and Prevention Systems (IDPS)"

NEW QUESTION 5

Users are willing passwords on paper because of the number of passwords needed in an environment. Which of the following solutions is the best way to manage this situation and decrease risks?

- A. Increasing password complexity to require 31 least 16 characters
- B. implementing an SSO solution and integrating with applications
- C. Requiring users to use an open-source password manager
- D. Implementing an MFA solution to avoid reliance only on passwords

Answer: B

Explanation:

Implementing a Single Sign-On (SSO) solution and integrating it with applications is the best way to manage the situation and decrease risks. Here??s why:

? Reduced Password Fatigue: SSO allows users to log in once and gain access to multiple applications and systems without needing to remember and manage multiple passwords. This reduces the likelihood of users writing down passwords.

? Improved Security: By reducing the number of passwords users need to manage, SSO decreases the attack surface and potential for password-related security breaches. It also allows for the implementation of stronger authentication methods.

? User Convenience: SSO improves the user experience by simplifying the login process, which can lead to higher productivity and satisfaction.

? References:

NEW QUESTION 6

A global manufacturing company has an internal application that is critical to making products. This application cannot be updated and must be available in the production area. A security architect is implementing security for the application. Which of the following best describes the action the architect should take-?

- A. Disallow wireless access to the application.
- B. Deploy Intrusion detection capabilities using a network tap
- C. Create an acceptable use policy for the use of the application
- D. Create a separate network for users who need access to the application

Answer: D

Explanation:

Creating a separate network for users who need access to the application is the best action to secure an internal application that is critical to the production area and cannot be updated.

Why Separate Network?

? Network Segmentation: Isolates the critical application from the rest of the network, reducing the risk of compromise and limiting the potential impact of any security incidents.

? Controlled Access: Ensures that only authorized users have access to the application, enhancing security and reducing the attack surface.

? Minimized Risk: Segmentation helps in protecting the application from vulnerabilities that could be exploited from other parts of the network.

Other options, while beneficial, do not provide the same level of security for a critical application:

? A. Disallow wireless access: Useful but does not provide comprehensive protection.

- ? B. Deploy intrusion detection capabilities using a network tap: Enhances monitoring but does not provide the same level of isolation and control.
- ? C. Create an acceptable use policy: Important for governance but does not provide technical security controls.

References:

- ? CompTIA SecurityX Study Guide
- ? NIST Special Publication 800-125, "Guide to Security for Full Virtualization Technologies"
- ? "Network Segmentation Best Practices," Cisco Documentation

NEW QUESTION 7

Users must accept the terms presented in a captive portal when connecting to a guest network. Recently, users have reported that they are unable to access the Internet after joining the network. A network engineer observes the following:

- Users should be redirected to the captive portal.
- The Motive portal runs TLS 1.2
- Newer browser versions encounter security errors that cannot be bypassed
- Certain websites cause unexpected redirects

Which of the following most likely explains this behavior?

- A. The TLS ciphers supported by the captive portal are deprecated
- B. Employment of the HSTS setting is proliferating rapidly.
- C. Allowed traffic rules are causing the NIPS to drop legitimate traffic
- D. An attacker is redirecting supplicants to an evil twin WLAN.

Answer: A

Explanation:

The most likely explanation for the issues encountered with the captive portal is that the TLS ciphers supported by the captive portal are deprecated. Here's why:

? TLS Cipher Suites: Modern browsers are continuously updated to support the latest security standards and often drop support for deprecated and insecure cipher suites. If the captive portal uses outdated TLS ciphers, newer browsers may refuse to connect, causing security errors.

? HSTS and Browser Security: Browsers with HTTP Strict Transport Security

(HSTS) enabled will not allow connections to sites with weak security configurations. Deprecated TLS ciphers would cause these browsers to block the connection.

? References:

By updating the TLS ciphers to modern, supported ones, the security engineer can ensure compatibility with newer browser versions and resolve the connectivity issues reported by users.

NEW QUESTION 8

SIMULATION

You are a security analyst tasked with interpreting an Nmap scan output from company's privileged network.

The company's hardening guidelines indicate the following: There should be one primary server or service per device. Only default ports should be used.

Non-secure protocols should be disabled.

INSTRUCTIONS

Using the Nmap output, identify the devices on the network and their roles, and any open ports that should be closed.

For each device found by Nmap, add a device entry to the Devices Discovered list, with the following information:

The IP address of the device

The primary server or service of the device (Note that each IP should be associated with one service/port only)

The protocol(s) that should be disabled based on the hardening guidelines (Note that multiple ports may need to be closed to comply with the hardening guidelines)

If at any time you would like to bring back the initial state of the simulation, please click the Reset All button.

```

NEW QUESTION 9

During a security assessment using an EDR solution, a security engineer generates the following report about the assets in the system:

Device	Type	Status
LN002	Linux SE	Enabled (unmanaged)
OWIN23	Windows 7	Enabled
OWIN29	Windows 10	Enabled (bypass)

After five days, the EDR console reports an infection on the host OWIN23 by a remote access Trojan. Which of the following is the most probable cause of the infection?

- A. OWIN23 uses a legacy version of Windows that is not supported by the EDR
- B. LN002 was not supported by the EDR solution and propagates the RAT
- C. The EDR has an unknown vulnerability that was exploited by the attacker.
- D. OWIN29 spreads the malware through other hosts in the network

Answer: A

Explanation:

OWIN23 is running Windows 7, which is a legacy operating system. Many EDR solutions no longer provide full support for outdated operating systems like Windows 7, which has reached its end of life and is no longer receiving security updates from Microsoft. This makes such systems more vulnerable to infections and attacks, including remote access Trojans (RATs).

? A. OWIN23 uses a legacy version of Windows that is not supported by the EDR:

This is the most probable cause because the lack of support means that the EDR solution may not fully protect or monitor this system, making it an easy target for infections.

? B. LN002 was not supported by the EDR solution and propagates the RAT: While LN002 is unmanaged, it is less likely to propagate the RAT to OWIN23 directly without an established vector.

? C. The EDR has an unknown vulnerability that was exploited by the attacker: This is possible but less likely than the lack of support for an outdated OS.

? D. OWIN29 spreads the malware through other hosts in the network: While this could happen, the status indicates OWIN29 is in a bypass mode, which might limit its interactions but does not directly explain the infection on OWIN23.

NEW QUESTION 10

Which of the following is the main reason quantum computing advancements are leading companies and countries to deploy new encryption algorithms?

- A. Encryption systems based on large prime numbers will be vulnerable to exploitation
- B. Zero Trust security architectures will require homomorphic encryption.
- C. Perfect forward secrecy will prevent deployment of advanced firewall monitoring techniques
- D. Quantum computers will enable malicious actors to capture IP traffic in real time

Answer: A

Explanation:

Advancements in quantum computing pose a significant threat to current encryption systems, especially those based on the difficulty of factoring large prime numbers, such as RSA. Quantum computers have the potential to solve these problems exponentially faster than classical computers, making current cryptographic systems vulnerable.

Why Large Prime Numbers are Vulnerable:

? Shor's Algorithm: Quantum computers can use Shor's algorithm to factorize large integers efficiently, which undermines the security of RSA encryption.

? Cryptographic Breakthrough: The ability to quickly factor large prime numbers means that encrypted data, which relies on the hardness of this mathematical problem, can be decrypted.

Other options, while relevant, do not capture the primary reason for the shift towards new encryption algorithms:

? B. Zero Trust security architectures: While important, the shift to homomorphic encryption is not the main driver for new encryption algorithms.

? C. Perfect forward secrecy: It enhances security but is not the main reason for new encryption algorithms.

? D. Real-time IP traffic capture: Quantum computers pose a more significant threat to the underlying cryptographic algorithms than to the real-time capture of traffic.

References:

? CompTIA SecurityX Study Guide

? NIST Special Publication 800-208, "Recommendation for Stateful Hash-Based Signature Schemes"

NEW QUESTION 10

A security analyst received a notification from a cloud service provider regarding an attack detected on a web server. The cloud service provider shared the following information about the attack:

- The attack came from inside the network.
- The attacking source IP was from the internal vulnerability scanners.
- The scanner is not configured to target the cloud servers.

Which of the following actions should the security analyst take first?

- A. Create an allow list for the vulnerability scanner IPs in order to avoid false positives

- B. Configure the scan policy to avoid targeting an out-of-scope host
- C. Set network behavior analysis rules
- D. Quarantine the scanner sensor to perform a forensic analysis

Answer: D

Explanation:

When a security analyst receives a notification about an attack that appears to originate from an internal vulnerability scanner, it suggests that the scanner itself might have been compromised. This situation is critical because a compromised scanner can potentially conduct unauthorized scans, leak sensitive information, or execute malicious actions within the network. The appropriate first action involves containing the threat to prevent further damage and allow for a thorough investigation.

Here's why quarantining the scanner sensor is the best immediate action:

? Containment and Isolation: Quarantining the scanner will immediately prevent it

from continuing any malicious activity or scans. This containment is crucial to protect the rest of the network from potential harm.

? Forensic Analysis: By isolating the scanner, a forensic analysis can be performed to understand how it was compromised, what actions it took, and what data or systems might have been affected. This analysis will provide valuable insights into the nature of the attack and help in taking appropriate remedial actions.

? Preventing Further Attacks: If the scanner is allowed to continue operating, it might execute more unauthorized actions, leading to greater damage. Quarantine ensures that the threat is neutralized promptly.

? Root Cause Identification: A forensic analysis can help identify vulnerabilities in the scanner's configuration, software, or underlying system that allowed the compromise. This information is essential for preventing future incidents.

Other options, while potentially useful in the long term, are not appropriate as immediate actions in this scenario:

? A. Create an allow list for the vulnerability scanner IPs to avoid false positives:

This action addresses false positives but does not mitigate the immediate threat posed by the compromised scanner.

? B. Configure the scan policy to avoid targeting an out-of-scope host: This step is preventive for future scans but does not deal with the current incident where the scanner is already compromised.

? C. Set network behavior analysis rules: While useful for ongoing monitoring and detection, this does not address the immediate need to stop the compromised scanner's activities.

In conclusion, the first and most crucial action is to quarantine the scanner sensor to halt any malicious activity and perform a forensic analysis to understand the scope and nature of the compromise. This step ensures that the threat is contained and provides a basis for further remediation efforts.

NEW QUESTION 12

A security engineer is developing a solution to meet the following requirements?

- All endpoints should be able to establish telemetry with a SIEM.
 - All endpoints should be able to be integrated into the XDR platform.
 - SOC services should be able to monitor the XDR platform
- Which of the following should the security engineer implement to meet the requirements?

- A. CDR and central logging
- B. HIDS and vTPM
- C. WAF and syslog
- D. HIPS and host-based firewall

Answer: D

Explanation:

To meet the requirements of having all endpoints establish telemetry with a SIEM, integrate into an XDR platform, and allow SOC services to monitor the XDR platform, the best approach is to implement Host Intrusion Prevention Systems (HIPS) and a host-based firewall. HIPS can provide detailed telemetry data to the SIEM and can be integrated into the XDR platform for comprehensive monitoring and response. The host-based firewall ensures that only authorized traffic is allowed, providing an additional layer of security.

References:

? CompTIA SecurityX Study Guide: Describes the roles of HIPS and host-based firewalls in endpoint security and their integration with SIEM and XDR platforms.

? NIST Special Publication 800-94, "Guide to Intrusion Detection and Prevention Systems (IDPS)": Highlights the capabilities of HIPS for security monitoring and incident response.

? "Network Security Monitoring" by Richard Bejtlich: Discusses the integration of various security tools, including HIPS and firewalls, for effective security monitoring.

NEW QUESTION 14

A security engineer is building a solution to disable weak CBC configuration for remote access connections to Linux systems. Which of the following should the security engineer modify?

- A. The /etc/openssl.conf file, updating the virtual site parameter
- B. The /etc/nsswith.conf file, updating the name server
- C. The /etc/hosts file, updating the IP parameter
- D. The /etc/ssh/sshd_config file, updating the ciphers

Answer: D

Explanation:

The sshd_config file is the main configuration file for the OpenSSH server. To disable weak CBC (Cipher Block Chaining) ciphers for SSH connections, the security engineer should modify the sshd_config file to update the list of allowed ciphers. This file typically contains settings for the SSH daemon, including which encryption algorithms are allowed.

By editing the /etc/ssh/sshd_config file and updating the Ciphers directive, weak ciphers can be removed, and only strong ciphers can be allowed. This change ensures that the

SSH server does not use insecure encryption methods.

References:

? CompTIA Security+ Study Guide

? OpenSSH manual pages (man sshd_config)

? CIS Benchmarks for Linux

NEW QUESTION 15

Recent reports indicate that a software tool is being exploited. Attackers were able to bypass user access controls and load a database. A security analyst needs to find the vulnerability and recommend a mitigation. The analyst generates the following output:

```
C:\>whoami
local-user
C:\>netuser local-user Welcome!
The command completed successfully!
C:\>dbloader.exe local-user Welcome!
Insufficient Permissions. Now Closing...
C:\>strings dbloader.exe
!This program cannot be run in DOS Mode
dB10ad3r!
Load Database jmp
182(*nx
(i3jN+jk
fahn82mk0a
C:\>dbloader.exe admin dB10ad3r!
```

Which of the following would the analyst most likely recommend?

- A. Installing appropriate EDR tools to block pass-the-hash attempts
- B. Adding additional time to software development to perform fuzz testing
- C. Removing hard-coded credentials from the source code
- D. Not allowing users to change their local passwords

Answer: C

Explanation:

The output indicates that the software tool contains hard-coded credentials, which attackers can exploit to bypass user access controls and load the database. The most likely recommendation is to remove hard-coded credentials from the source code. Here's why:

- ? Security Best Practices: Hard-coded credentials are a significant security risk because they can be easily discovered through reverse engineering or simple inspection of the code. Removing them reduces the risk of unauthorized access.
- ? Credential Management: Credentials should be managed securely using environment variables, secure vaults, or configuration management tools that provide encryption and access controls.
- ? Mitigation of Exploits: By eliminating hard-coded credentials, the organization can prevent attackers from easily bypassing authentication mechanisms and gaining unauthorized access to sensitive systems.
- ? References:

NEW QUESTION 16

An audit finding reveals that a legacy platform has not retained logs for more than 30 days. The platform has been segmented due to its interoperability with newer technology. As a temporary solution, the IT department changed the log retention to 120 days. Which of the following should the security engineer do to ensure the logs are being properly retained?

- A. Configure a scheduled task nightly to save the logs
- B. Configure event-based triggers to export the logs at a threshold.
- C. Configure the SIEM to aggregate the logs
- D. Configure a Python script to move the logs into a SQL database.

Answer: C

Explanation:

To ensure that logs from a legacy platform are properly retained beyond the default retention period, configuring the SIEM to aggregate the logs is the best approach. SIEM solutions are designed to collect, aggregate, and store logs from various sources, providing centralized log management and retention. This setup ensures that logs are retained according to policy and can be easily accessed for analysis and compliance purposes. References:

- ? CompTIA SecurityX Study Guide: Discusses the role of SIEM in log management and retention.
- ? NIST Special Publication 800-92, "Guide to Computer Security Log Management": Recommends the use of centralized log management solutions, such as SIEM, for effective log retention and analysis.
- ? "Security Information and Event Management (SIEM) Implementation" by David Miller: Covers best practices for configuring SIEM systems to aggregate and retain logs from various sources.

NEW QUESTION 17

A security analyst is reviewing the following authentication logs:

Date	Time	Computer	Account	Log-in success?
12/15	8:01:23AM	VM01	User1	No
12/15	8:01:23AM	VM01	User1	No
12/15	8:01:23AM	VM08	User8	No
12/15	8:01:23AM	VM01	User1	No
12/15	8:01:23AM	VM01	User1	No
12/15	8:01:23AM	VM12	User12	Yes
12/15	8:01:23AM	VM01	User1	Yes
12/15	8:01:23AM	VM01	User2	No
12/15	8:01:24AM	VM01	User2	No
12/15	8:01:24AM	VM01	User2	No
12/15	8:01:25AM	VM01	User2	No
12/15	8:01:25AM	VM08	User8	Yes

Which of the following should the analyst do first?

- A. Disable User2's account
- B. Disable User12's account
- C. Disable User8's account
- D. Disable User1's account

Answer: D

Explanation:

Based on the provided authentication logs, we observe that User1's account experienced multiple failed login attempts within a very short time span (at 8:01:23 AM on 12/15). This pattern indicates a potential brute-force attack or an attempt to gain unauthorized access. Here's a breakdown of why disabling User1's account is the appropriate first step:

? Failed Login Attempts: The logs show that User1 had four consecutive failed login attempts:

? Security Protocols and Best Practices: According to CompTIA Security+ guidelines, multiple failed login attempts within a short timeframe should trigger an immediate response to prevent further potential unauthorized access attempts. This typically involves temporarily disabling the account to stop ongoing brute-force attacks.

? Account Lockout Policy: Implementing an account lockout policy is a standard practice to thwart brute-force attacks. Disabling User1's account will align with these best practices and prevent further failed attempts, which might lead to successful unauthorized access if not addressed.

? References:

By addressing User1's account first, we effectively mitigate the immediate threat of a brute-force attack, ensuring that further investigation can be conducted without the risk of unauthorized access continuing during the investigation period.

NEW QUESTION 19

Which of the following is the security engineer most likely doing?

Account	Host	Log-in date	Local log-in time	Office location
Sales_1	PC-18	4/16	9:05 a.m.	USA
Sales_1	PC-18	4/17	9:10 a.m.	USA
Sales_1	PC-10	4/18	9:08 a.m.	USA
Sales_1	PC-10	4/19	9:01 a.m.	USA
Sales_1	PC-64	4/21	8:58 a.m.	UK

- A. Assessing log in activities using geolocation to tune impossible Travel rate alerts
- B. Reporting on remote log-in activities to track team metrics
- C. Threat hunting for suspicious activity from an insider threat
- D. Baseline user behavior to support advanced analytics

Answer: A

Explanation:

In the given scenario, the security engineer is likely examining login activities and their associated geolocations. This type of analysis is aimed at identifying unusual login patterns that might indicate an impossible travel scenario. An impossible travel scenario is when a single user account logs in from geographically distant locations in a short time, which is physically impossible. By assessing login activities using geolocation, the engineer can tune alerts to identify and respond to potential security breaches more effectively.

NEW QUESTION 22

A company's security policy states that any publicly available server must be patched within 12 hours after a patch is released. A recent IIS zero-day vulnerability was discovered that affects all versions of the Windows Server OS:

	OS	Externally available?	Behind WAF?	IIS installed?
Host 1	Windows 2019	Yes	Yes	Yes
Host 2	Windows 2008 R2	No	N/A	No
Host 3	Windows 2012 R2	Yes	Yes	Yes
Host 4	Windows 2022	Yes	No	Yes
Host 5	Windows 2012 R2	No	N/A	No
Host 6	Windows 2019	Yes	No	No

Which of the following hosts should a security analyst patch first once a patch is available?

- A. 1
- B. 2
- C. 3
- D. 4
- E. 5
- F. 6

Answer: A

Explanation:

Based on the security policy that any publicly available server must be patched within 12 hours after a patch is released, the security analyst should patch Host 1 first. Here's why:

- ? Public Availability: Host 1 is externally available, making it accessible from the internet. Publicly available servers are at higher risk of being targeted by attackers, especially when a zero-day vulnerability is known.
- ? Exposure to Threats: Host 1 has IIS installed and is publicly accessible, increasing its exposure to potential exploitation. Patching this host first reduces the risk of a successful attack.
- ? Prioritization of Critical Assets: According to best practices, assets that are exposed to higher risks should be prioritized for patching to mitigate potential threats promptly.
- ? References:

NEW QUESTION 26

An engineering team determines the cost to mitigate certain risks is higher than the asset values. The team must ensure the risks are prioritized appropriately. Which of the following is the best way to address the issue?

- A. Data labeling
- B. Branch protection
- C. Vulnerability assessments
- D. Purchasing insurance

Answer: D

Explanation:

When the cost to mitigate certain risks is higher than the asset values, the best approach is to purchase insurance. This method allows the company to transfer the risk to an insurance provider, ensuring that financial losses are covered in the event of an incident. This approach is cost-effective and ensures that risks are prioritized appropriately without overspending on mitigation efforts.

- References:
- ? CompTIA SecurityX Study Guide: Discusses risk management strategies, including risk transfer through insurance.
 - ? NIST Risk Management Framework (RMF): Highlights the use of insurance as a risk mitigation strategy.
 - ? "Information Security Risk Assessment Toolkit" by Mark Talabis and Jason Martin: Covers risk management practices, including the benefits of purchasing insurance.

NEW QUESTION 28

An organization that performs real-time financial processing is implementing a new backup solution. Given the following business requirements?

- * The backup solution must reduce the risk for potential backup compromise
- * The backup solution must be resilient to a ransomware attack.
- * The time to restore from backups is less important than the backup data integrity
- * Multiple copies of production data must be maintained

Which of the following backup strategies best meets these requirements?

- A. Creating a secondary, immutable storage array and updating it with live data on a continuous basis
- B. Utilizing two connected storage arrays and ensuring the arrays constantly sync
- C. Enabling remote journaling on the databases to ensure real-time transactions are mirrored
- D. Setting up antitempering on the databases to ensure data cannot be changed unintentionally

Answer: A

Explanation:

? A. Creating a secondary, immutable storage array and updating it with live data on a continuous basis: An immutable storage array ensures that data, once written, cannot be altered or deleted. This greatly reduces the risk of backup compromise and provides resilience against ransomware attacks, as the ransomware cannot modify or delete the backup data. Maintaining multiple copies of production data with an immutable storage solution ensures data integrity and compliance with the requirement for multiple copies.

Other options:

? B. Utilizing two connected storage arrays and ensuring the arrays constantly sync: While this ensures data redundancy, it does not provide protection against ransomware attacks, as both arrays could be compromised simultaneously.

? C. Enabling remote journaling on the databases: This ensures real-time transaction mirroring but does not address the requirement for reducing the risk of backup compromise or resilience to ransomware.

? D. Setting up anti-tampering on the databases: While this helps ensure data integrity, it does not provide a comprehensive backup solution that meets all the specified requirements.

References:

? CompTIA Security+ Study Guide

? NIST SP 800-209, "Security Guidelines for Storage Infrastructure"

? "Immutable Backup Architecture" by Veeam

NEW QUESTION 32

Which of the following best explains the importance of determining organization risk appetite when operating with a constrained budget?

- A. Risk appetite directly impacts acceptance of high-impact low-likelihood events.
- B. Organizational risk appetite varies from organization to organization
- C. Budgetary pressure drives risk mitigation planning in all companies
- D. Risk appetite directly influences which breaches are disclosed publicly

Answer: A

Explanation:

Risk appetite is the amount of risk an organization is willing to accept to achieve its objectives. When operating with a constrained budget, understanding the organization's risk appetite is crucial because:

? It helps prioritize security investments based on the level of risk the organization is willing to tolerate.

? High-impact, low-likelihood events may be deemed acceptable if they fall within the organization's risk appetite, allowing for budget allocation to other critical areas.

? Properly understanding and defining risk appetite ensures that limited resources are used effectively to manage risks that align with the organization's strategic goals.

References:

? CompTIA Security+ Study Guide

? NIST Risk Management Framework (RMF) guidelines

? ISO 31000, "Risk Management – Guidelines"

NEW QUESTION 33

Users are experiencing a variety of issues when trying to access corporate resources examples include

- Connectivity issues between local computers and file servers within branch offices
- Inability to download corporate applications on mobile endpoints while working remotely
- Certificate errors when accessing internal web applications

Which of the following actions are the most relevant when troubleshooting the reported issues? (Select two).

- A. Review VPN throughput
- B. Check IPS rules
- C. Restore static content on lite CDN.
- D. Enable secure authentication using NAC
- E. Implement advanced WAF rules.
- F. Validate MDM asset compliance

Answer: AF

Explanation:

The reported issues suggest problems related to network connectivity, remote access, and certificate management:

? A. Review VPN throughput: Connectivity issues and the inability to download applications while working remotely may be due to VPN bandwidth or performance issues. Reviewing and optimizing VPN throughput can help resolve these problems by ensuring that remote users have adequate bandwidth for accessing corporate resources.

? F. Validate MDM asset compliance: Mobile Device Management (MDM) systems

ensure that mobile endpoints comply with corporate security policies. Validating MDM compliance can help address issues related to the inability to download applications and certificate errors, as non-compliant devices might be blocked from accessing certain resources.

? B. Check IPS rules: While important for security, IPS rules are less likely to directly address the connectivity and certificate issues described.

? C. Restore static content on the CDN: This action is related to content delivery but does not address VPN or certificate-related issues.

? D. Enable secure authentication using NAC: Network Access Control (NAC) enhances security but does not directly address the specific issues described.

? E. Implement advanced WAF rules: Web Application Firewalls protect web applications but do not address VPN throughput or mobile device compliance.

References:

? CompTIA Security+ Study Guide

? NIST SP 800-77, "Guide to IPsec VPNs"

? CIS Controls, "Control 11: Secure Configuration for Network Devices"

NEW QUESTION 38

A security engineer is given the following requirements:

- An endpoint must only execute Internally signed applications
- Administrator accounts cannot install unauthorized software.
- Attempts to run unauthorized software must be logged Which of the following best meets these requirements?

- A. Maintaining appropriate account access through directory management and controls
- B. Implementing a CSPM platform to monitor updates being pushed to applications
- C. Deploying an EDR solution to monitor and respond to software installation attempts
- D. Configuring application control with blocked hashes and enterprise-trusted root certificates

Answer: D

Explanation:

To meet the requirements of only allowing internally signed applications, preventing unauthorized software installations, and logging attempts to run unauthorized software, configuring application control with blocked hashes and enterprise-trusted root certificates is the best solution. This approach ensures that only applications signed by trusted certificates are allowed to execute, while all other attempts are blocked and logged. It effectively prevents unauthorized software installations by restricting execution to pre- approved applications.

References:

- ? CompTIA SecurityX Study Guide: Describes application control mechanisms and the use of trusted certificates to enforce security policies.
- ? NIST Special Publication 800-53, "Security and Privacy Controls for Information Systems and Organizations": Recommends application whitelisting and execution control for securing endpoints.
- ? "The Application Security Handbook" by Mark Dowd, John McDonald, and Justin Schuh: Covers best practices for implementing application control and managing trusted certificates

NEW QUESTION 42

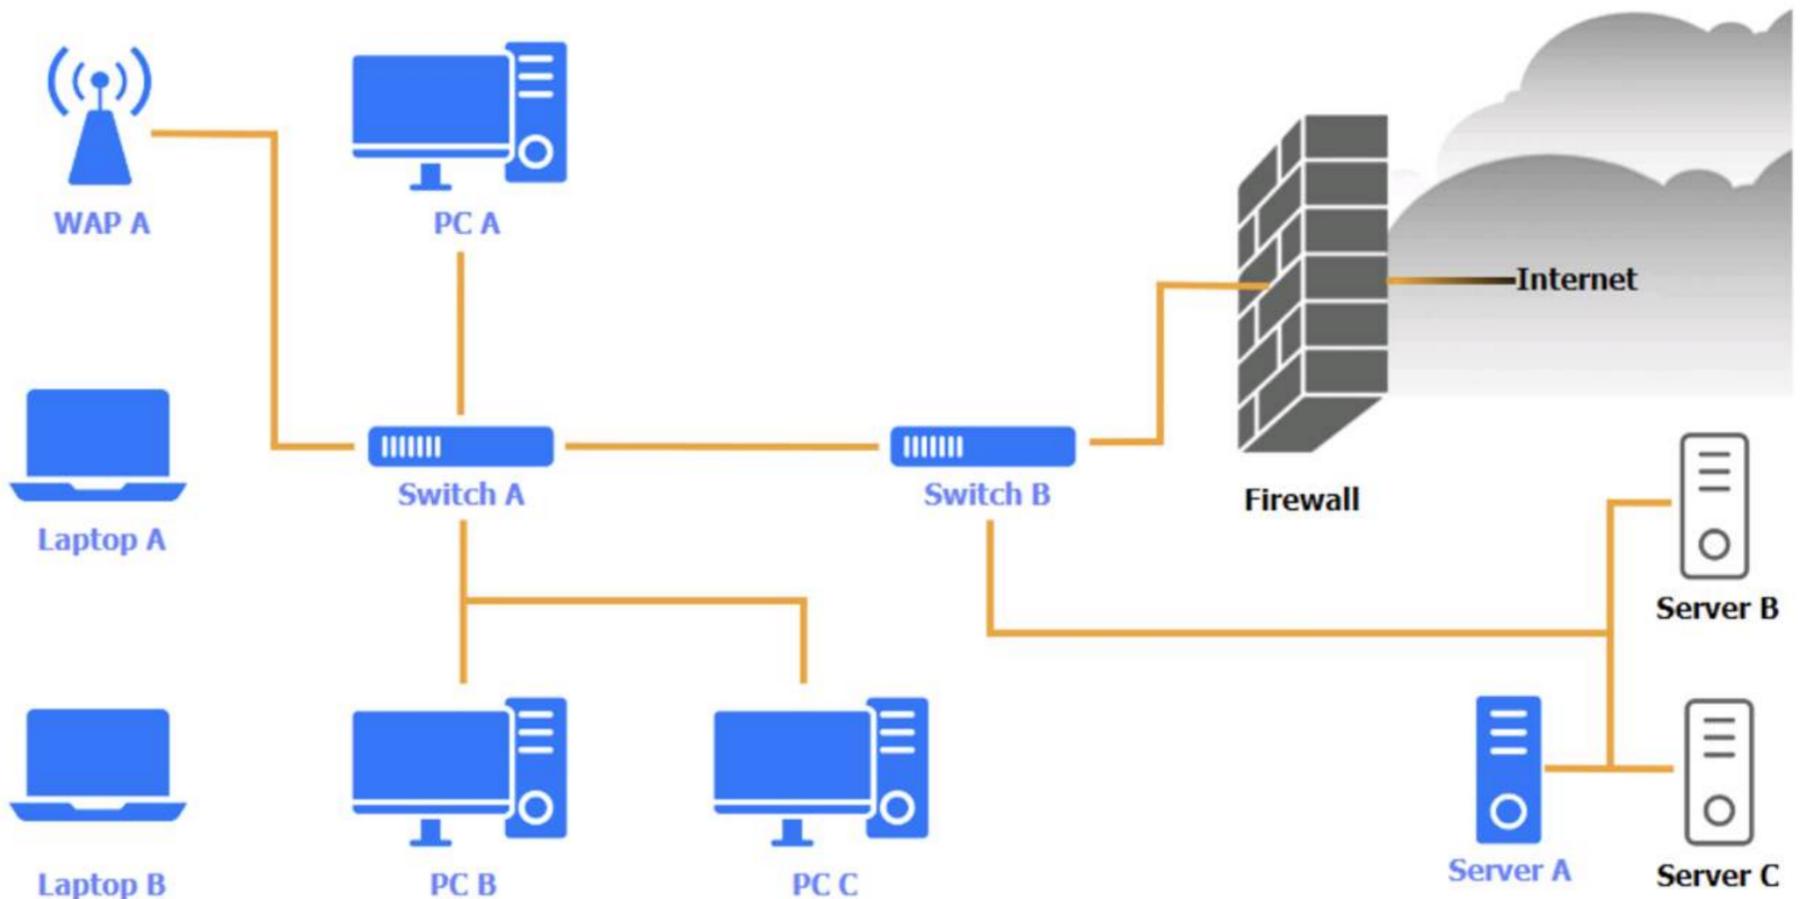

SIMULATION

A security engineer needs to review the configurations of several devices on the network to meet the following requirements:

- The PostgreSQL server must only allow connectivity in the 10.1.2.0/24 subnet.
- The SSH daemon on the database server must be configured to listen to port 4022.
- The SSH daemon must only accept connections from a Single workstation.
- All host-based firewalls must be disabled on all workstations.
- All devices must have the latest updates from within the past eight days.
- All HDDs must be configured to secure data at rest.
- Cleartext services are not allowed.
- All devices must be hardened when possible.

Instructions:

Click on the various workstations and network devices to review the posture assessment results. Remediate any possible issues or indicate that no issue is found. Click on Server A to review output data. Select commands in the appropriate tab to remediate connectivity problems to the pOSTGRESql DATABASE VIA ssh

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

WAP A: No issue found. The WAP A is configured correctly and meets the requirements. PC A = Enable host-based firewall to block all traffic
 This option will turn off the host-based firewall and allow all traffic to pass through. This will comply with the requirement and also improve the connectivity of PC A to other devices on the network. However, this option will also reduce the security of PC A and make it more vulnerable to attacks. Therefore, it is recommended to use other security measures, such as antivirus, encryption, and password complexity, to protect PC A from potential threats.

Laptop A: Patch management

This option will install the updates that are available for Laptop A and ensure that it has the most recent security patches and bug fixes. This will comply with the requirement and also improve the performance and stability of Laptop A. However, this option may also require a reboot of Laptop A and some downtime during the update process. Therefore, it is recommended to backup any important data and close any open applications before applying the updates.

Switch A: No issue found. The Switch A is configured correctly and meets the requirements.

Switch B: No issue found. The Switch B is configured correctly and meets the requirements.

Laptop B: Disable unneeded services

This option will stop and disable the telnet service that is using port 23 on Laptop B. Telnet

is a cleartext service that transmits data in plain text over the network, which exposes it to eavesdropping, interception, and modification by attackers. By disabling the telnet service, you will comply with the requirement and also improve the security of Laptop B. However, this option may also affect the functionality of Laptop B if it needs to use telnet for remote administration or other purposes. Therefore, it is recommended to use a secure alternative to telnet, such as SSH or HTTPS, that encrypts the data in transit.

PC B: Enable disk encryption

This option will encrypt the HDD of PC B using a tool such as BitLocker or VeraCrypt. Disk encryption is a technique that protects data at rest by converting it into an unreadable format that can only be decrypted with a valid key or password. By enabling disk encryption, you will comply with the requirement and also improve the confidentiality and integrity of PC B's data. However, this option may also affect the performance and usability of PC B, as it requires additional processing time and user authentication to access the encrypted data. Therefore, it is recommended to backup any important data and choose a strong key or password before encrypting the disk.

PC C: Disable unneeded services

This option will stop and disable the SSH daemon that is using port 22 on PC C. SSH is a secure service that allows remote access and command execution over an encrypted channel. However, port 22 is the default and well-known port for SSH, which makes it a common target for brute-force attacks and port scanning. By disabling the SSH daemon on port 22, you will comply with the requirement and also improve the security of PC C. However, this option may also affect the functionality of PC C if it needs to use SSH for remote administration or other purposes. Therefore, it is recommended to enable the SSH daemon on a different port, such as 4022, by editing the configuration file using the following command:

sudo nano /etc/ssh/sshd_config Server A. Need to select the following:

white screen with white text

```

1 2 3 4
iptables -R INPUT 1 -p tcp -s 10.1.2.0/24 --dport 4022 -j ACCEPT
iptables -D OUTPUT 2
iptables -A OUTPUT -p tcp -d 0/0 -s 10.1.2.0/24 --sport 5432 -m state --state ESTABLISHED -j ACCEPT
iptables -A INPUT -p tcp -d 0/0 -s 10.1.2.0/24 --dport 5432 -m state --state NEW,ESTABLISHED -j ACCEPT

```

NEW QUESTION 45

A financial technology firm works collaboratively with business partners in the industry to share threat intelligence within a central platform This collaboration gives partner organizations the ability to obtain and share data associated with emerging threats from a variety of adversaries Which of the following should the organization most likely leverage to facilitate this activity? (Select two).

- A. CWPP
- B. YAKA
- C. ATTACK
- D. STIX
- E. TAXII

F. JTAG

Answer: DE

Explanation:

? D. STIX (Structured Threat Information eXpression): STIX is a standardized language for representing threat information in a structured and machine-readable format. It facilitates the sharing of threat intelligence by ensuring that data is consistent and can be easily understood by all parties involved.

? E. TAXII (Trusted Automated eXchange of Indicator Information): TAXII is a transport mechanism that enables the sharing of cyber threat information over a secure and trusted network. It works in conjunction with STIX to automate the exchange of threat intelligence among organizations.

Other options:

? A. CWPP (Cloud Workload Protection Platform): This focuses on securing cloud workloads and is not directly related to threat intelligence sharing.

? B. YARA: YARA is used for malware research and identifying patterns in files, but it is not a platform for sharing threat intelligence.

? C. ATT&CK: This is a knowledge base of adversary tactics and techniques but does not facilitate the sharing of threat intelligence data.

? F. JTAG: JTAG is a standard for testing and debugging integrated circuits, not related to threat intelligence.

References:

? CompTIA Security+ Study Guide

? "STIX and TAXII: The Backbone of Threat Intelligence Sharing" by MITRE

? NIST SP 800-150, "Guide to Cyber Threat Information Sharing"

NEW QUESTION 47

A security team is responding to malicious activity and needs to determine the scope of impact the malicious activity appears to affect certain version of an application used by the organization Which of the following actions best enables the team to determine the scope of Impact?

- A. Performing a port scan
- B. Inspecting egress network traffic
- C. Reviewing the asset inventory
- D. Analyzing user behavior

Answer: C

Explanation:

Reviewing the asset inventory allows the security team to identify all instances of the affected application versions within the organization. By knowing which systems are running the vulnerable versions, the team can assess the full scope of the impact, determine which systems might be compromised, and prioritize them for further investigation and remediation.

Performing a port scan (Option A) might help identify open ports but does not provide specific information about the application versions. Inspecting egress network traffic (Option B) and analyzing user behavior (Option D) are important steps in the incident response process but do not directly identify which versions of the application are affected. References:

? CompTIA Security+ Study Guide

? NIST SP 800-61 Rev. 2, "Computer Security Incident Handling Guide"

? CIS Controls, "Control 1: Inventory and Control of Hardware Assets" and "Control 2: Inventory and Control of Software Assets"

NEW QUESTION 50

A company wants to install a three-tier approach to separate the web, database, and application servers A security administrator must harden the environment which of the following is the best solution?

- A. Deploying a VPN to prevent remote locations from accessing server VLANs
- B. Configuring a SASb solution to restrict users to server communication
- C. Implementing microsegmentation on the server VLANs
- D. installing a firewall and making it the network core

Answer: C

Explanation:

The best solution to harden a three-tier environment (web, database, and application servers) is to implement microsegmentation on the server VLANs. Here??s why:

? Enhanced Security: Microsegmentation creates granular security zones within the data center, allowing for more precise control over east-west traffic between servers. This helps prevent lateral movement by attackers who may gain access to one part of the network.

? Isolation of Tiers: By segmenting the web, database, and application servers, the organization can apply specific security policies and controls to each segment, reducing the risk of cross-tier attacks.

? Compliance and Best Practices: Microsegmentation aligns with best practices for network security and helps meet compliance requirements by ensuring that sensitive data and systems are properly isolated and protected.

? References:

NEW QUESTION 55

SIMULATION

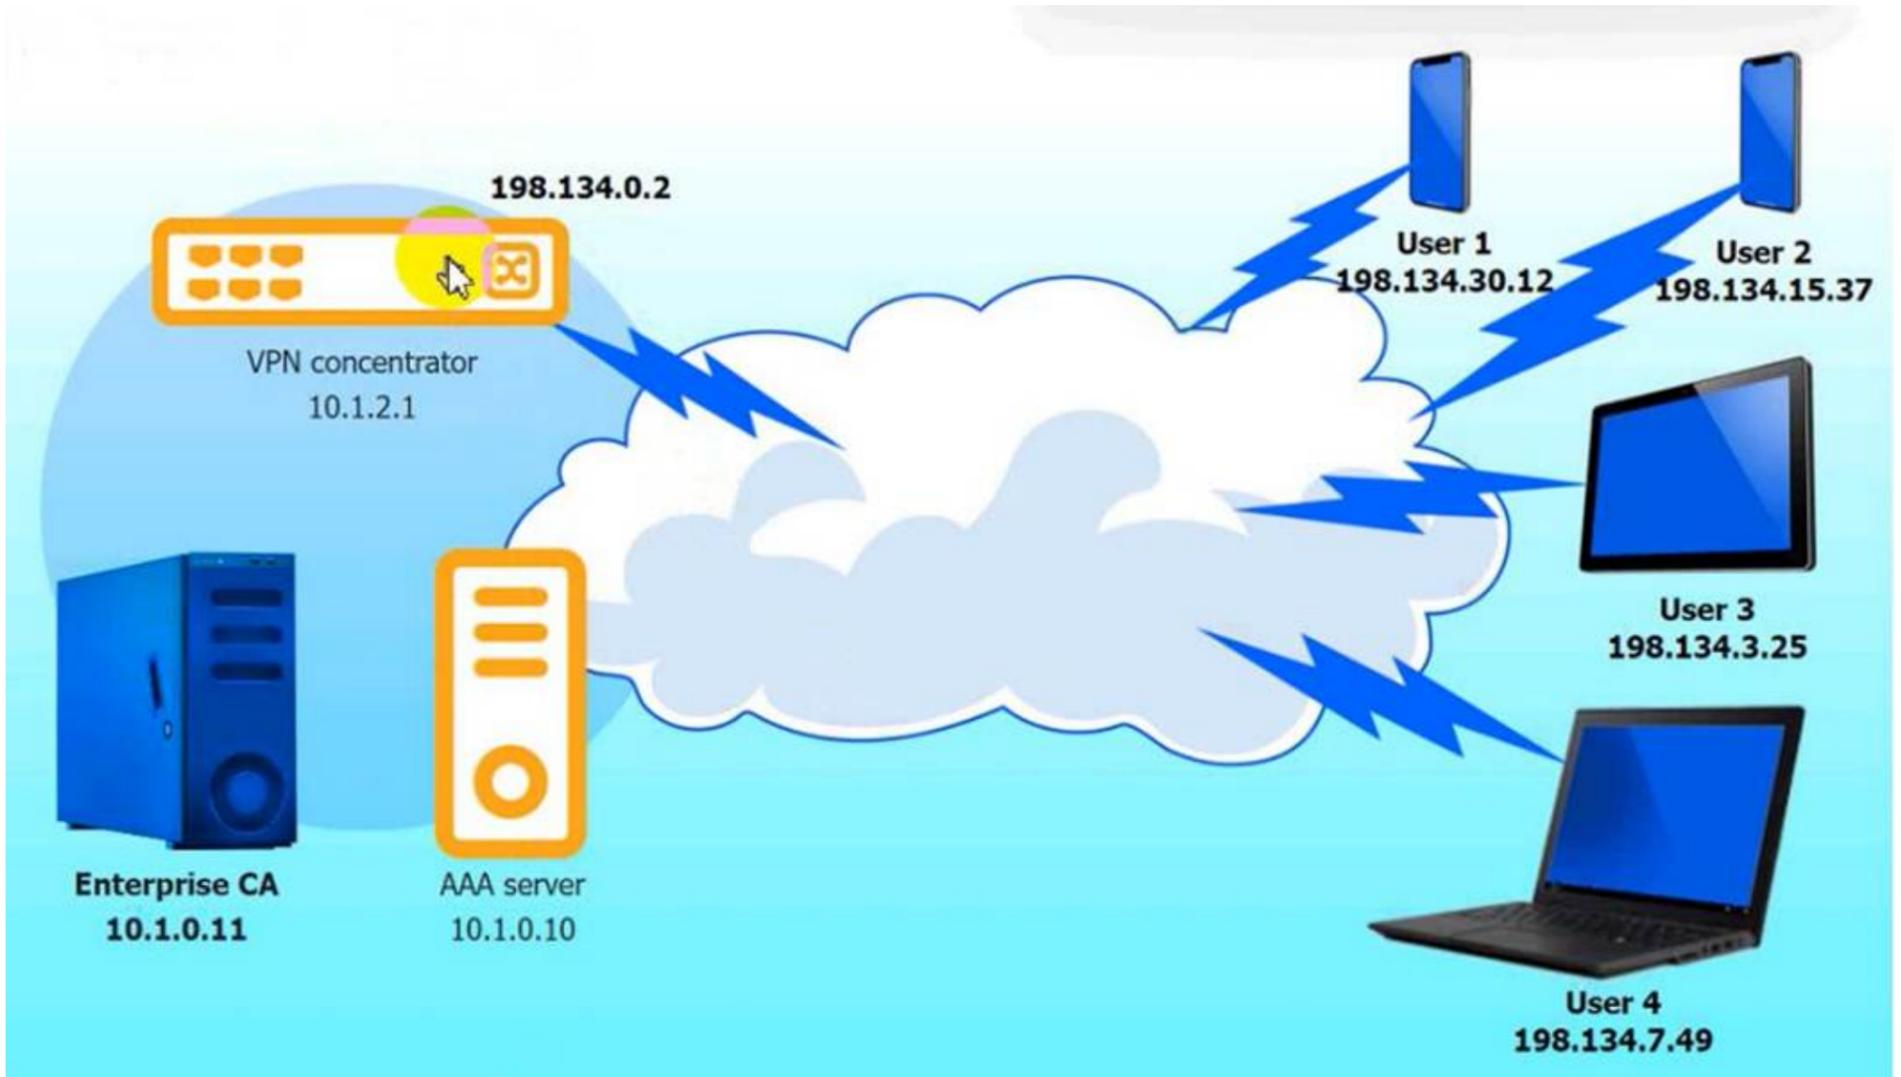

An IPsec solution is being deployed. The configuration files for both the VPN concentrator and the AAA server are shown in the diagram.

Complete the configuration files to meet the following requirements:

- The EAP method must use mutual certificate-based authentication (With issued client certificates).
- The IKEv2 Cipher suite must be configured to the MOST secure authenticated mode of operation,
- The secret must contain at least one uppercase character, one lowercase character, one numeric character, and one special character, and it must meet a minimum length requirement of eight characters,

INSTRUCTIONS

Click on the AAA server and VPN concentrator to complete the configuration. Fill in the appropriate fields and make selections from the drop-down menus.

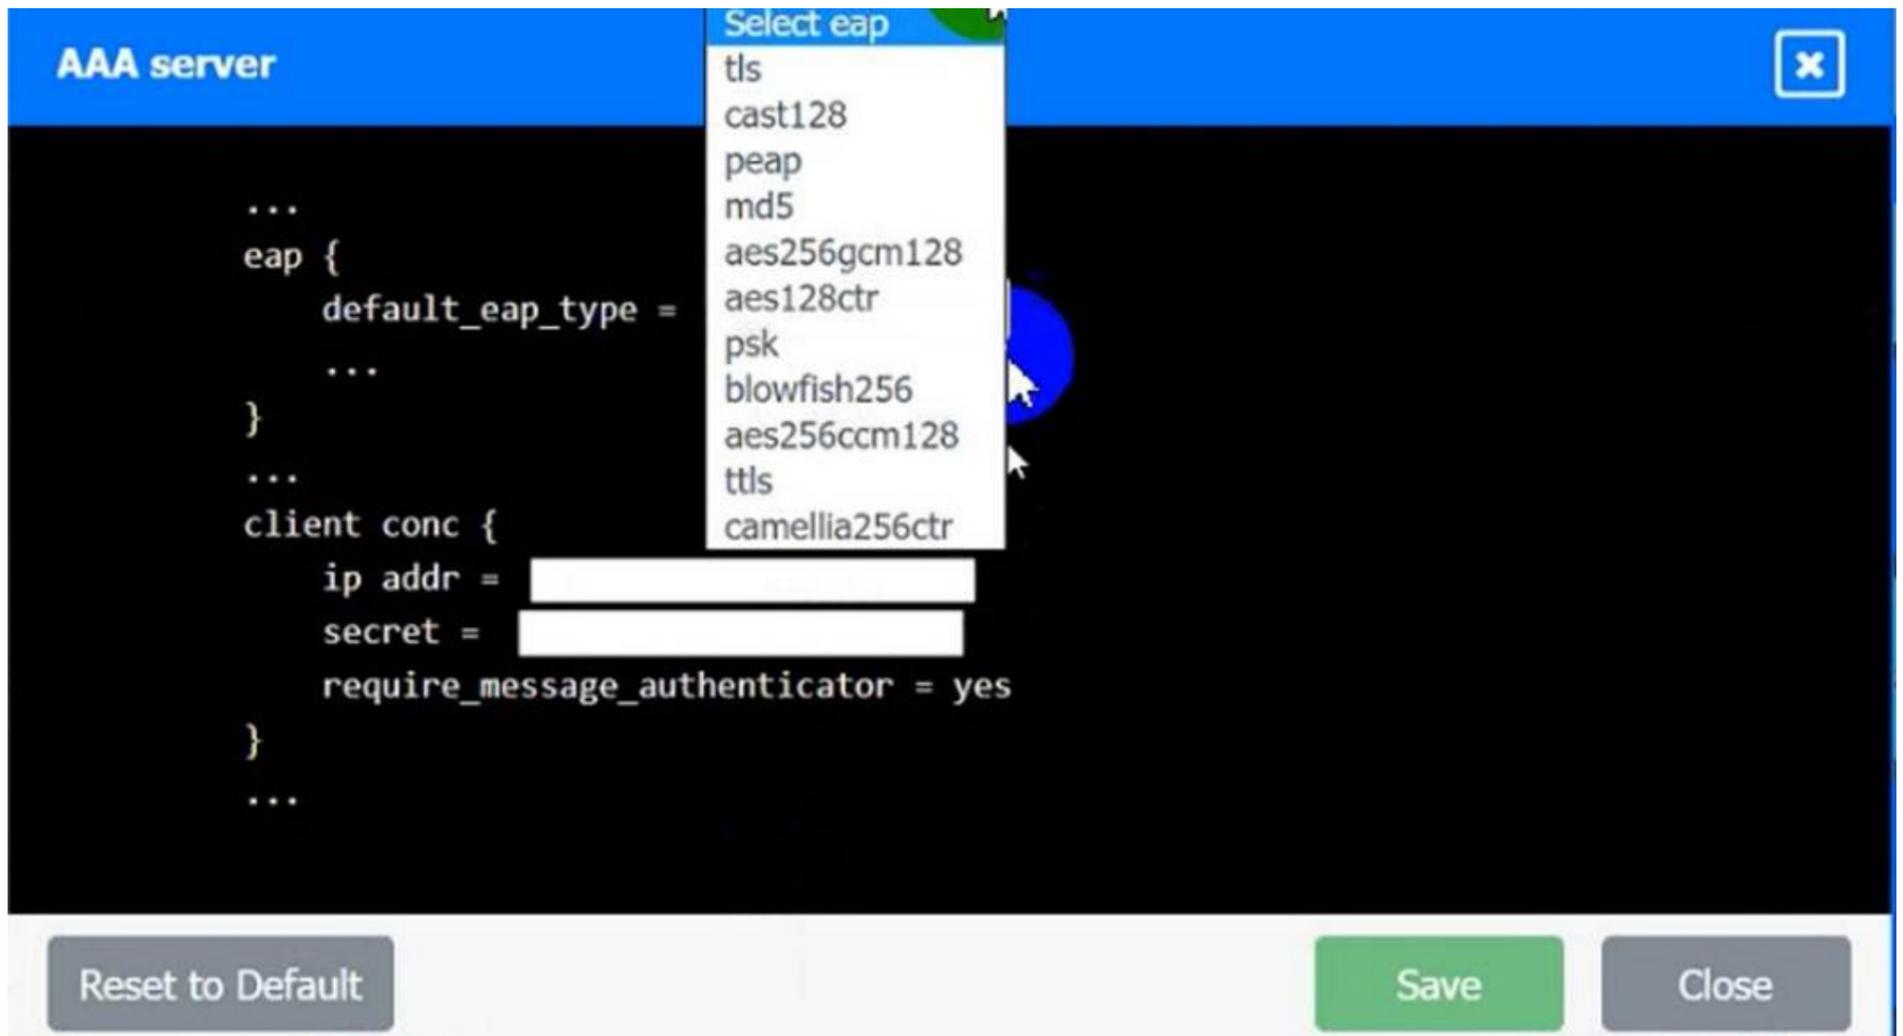

VPN Concentrator:

The screenshot shows the configuration interface for a VPN concentrator. The title bar reads "VPN concentrator". The main area displays configuration code for a proposal:

```
...  
re-eap {  
...  
  proposals =  
    ...  
}  
...  
plugins {  
  eap-radius {  
    secret =  
    server =  
  }  
}  
...
```

A dropdown menu is open over the "proposals =" line, listing the following options: peap, blowfish256, md5, aes256ccm128, aes128ctr, cast128, camellia256ctr, tls, ttls, psk, and aes256gcm128. At the bottom of the interface, there are three buttons: "Reset to Default", "Save", and "Close".

AAA Server:

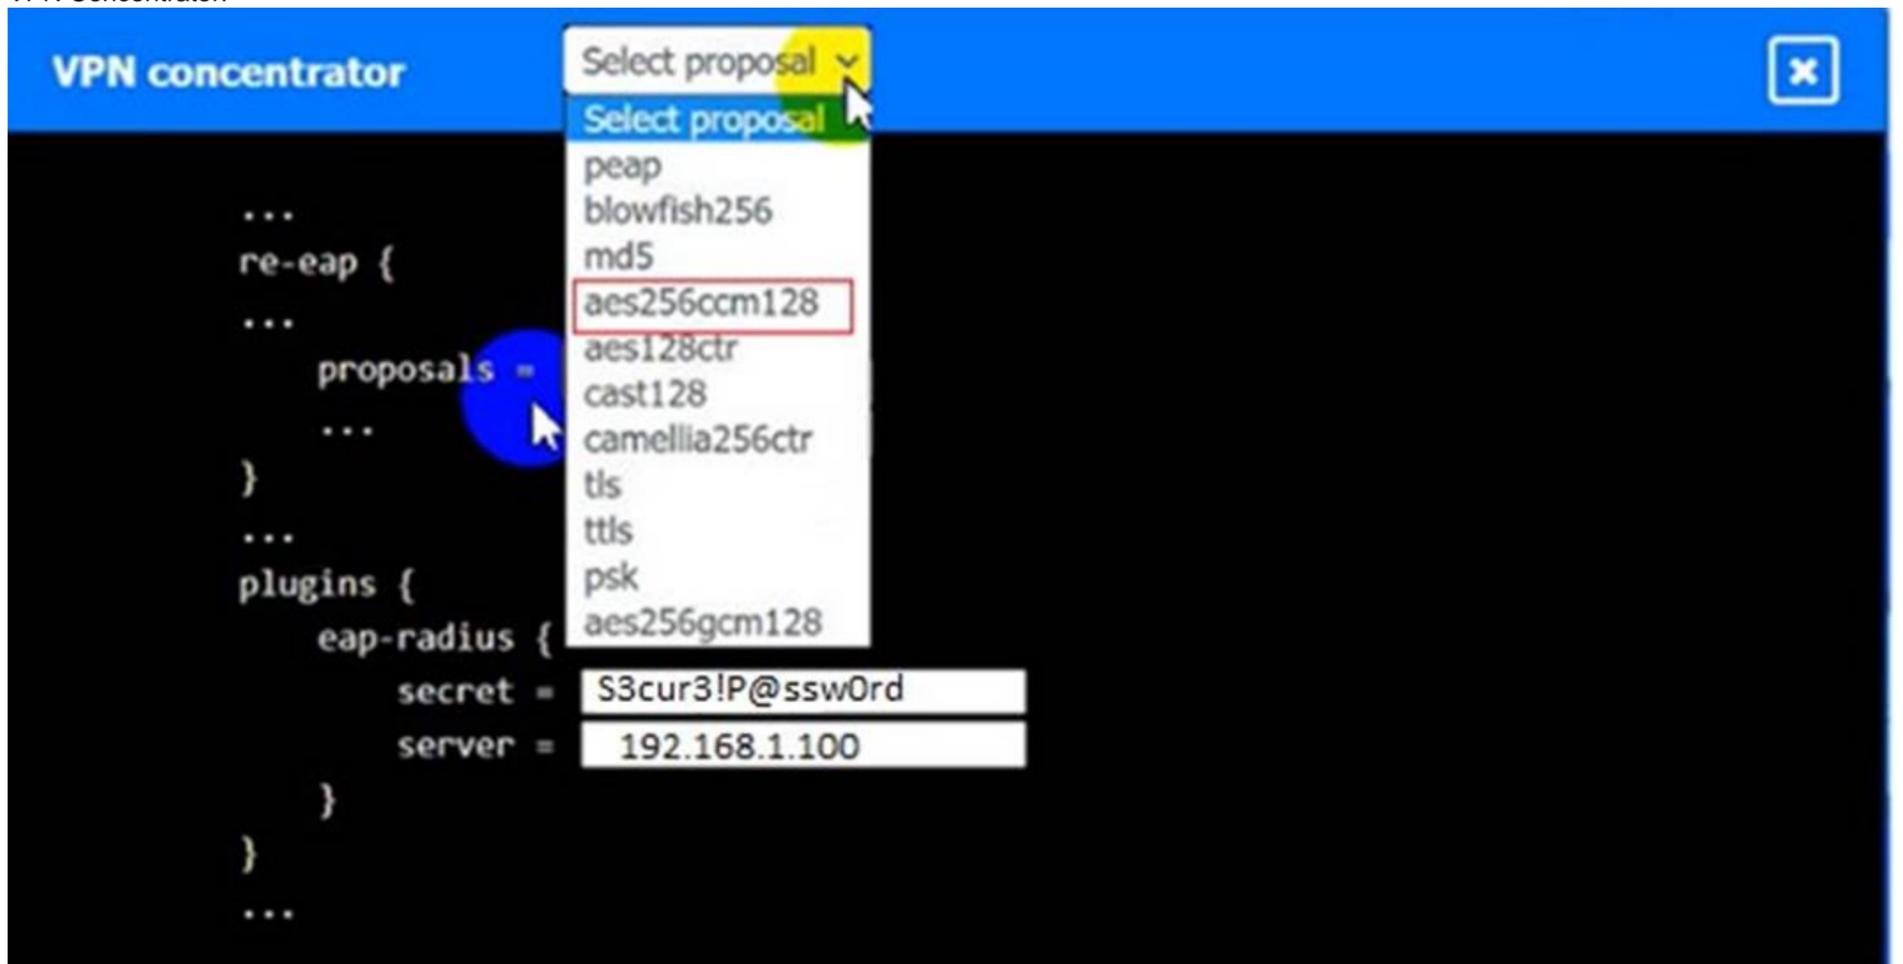

- A. Mastered
- B. Not Mastered

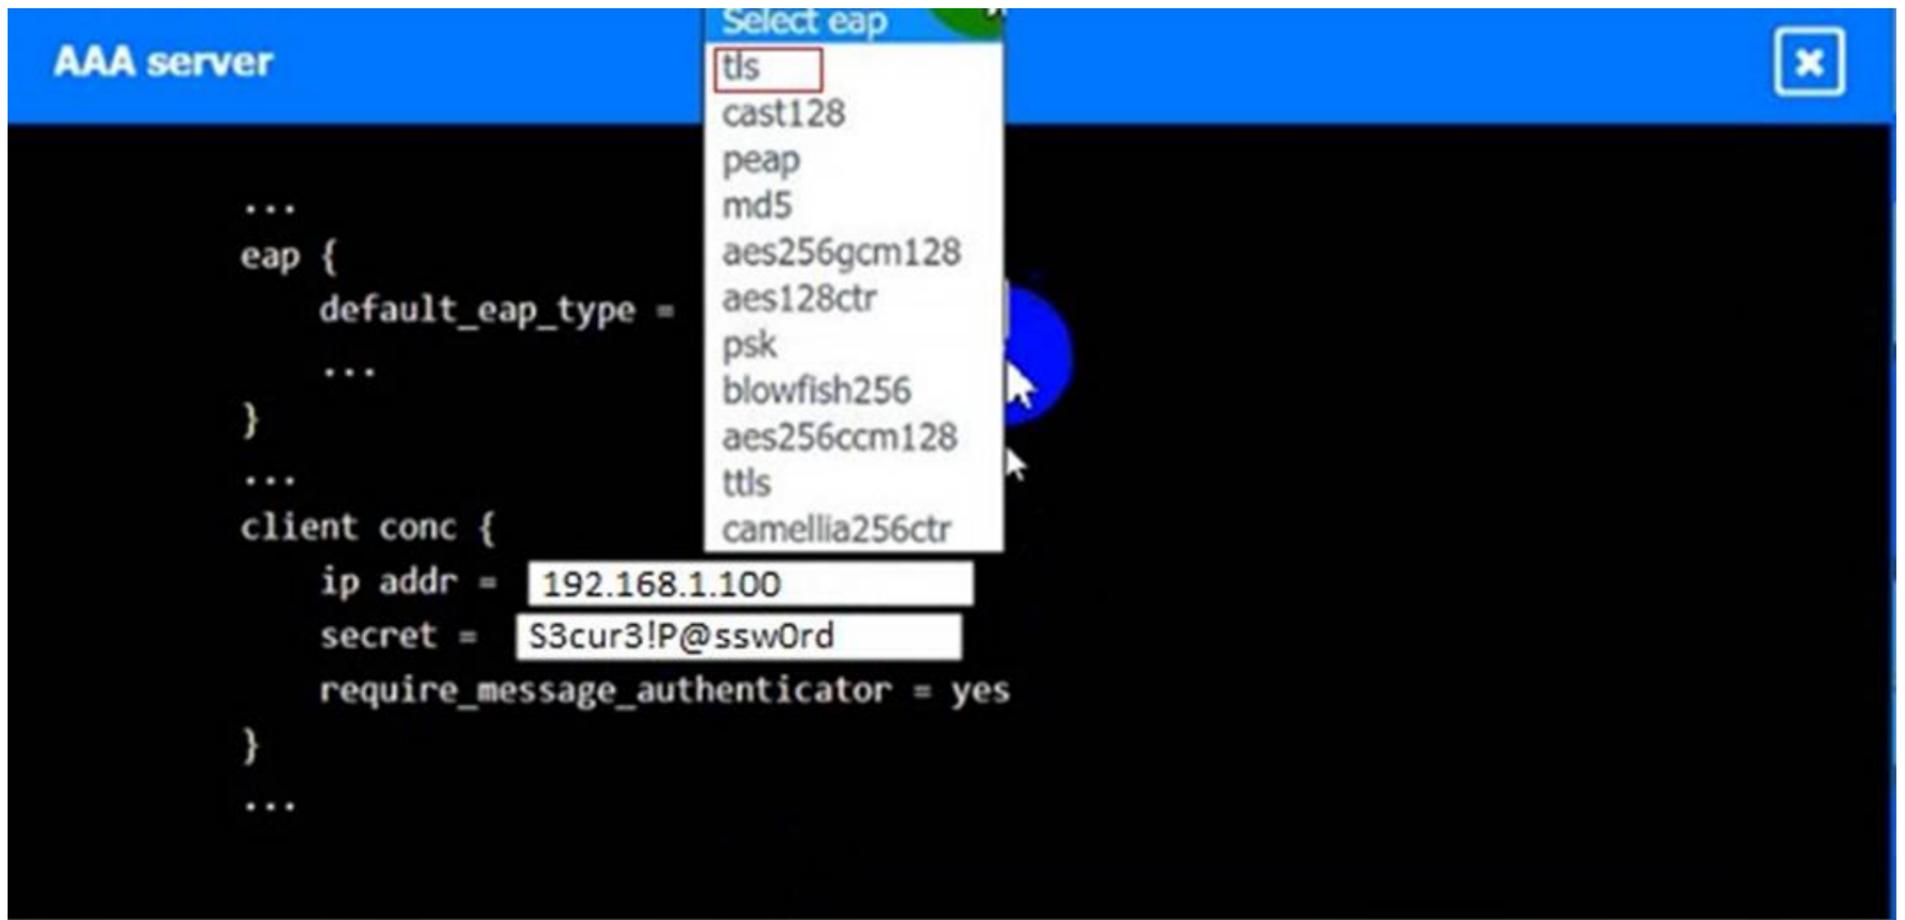

Answer: A

Explanation:

VPN Concentrator:

AAA Server:

NEW QUESTION 59

Third parties notified a company's security team about vulnerabilities in the company's application. The security team determined these vulnerabilities were previously disclosed in third-party libraries. Which of the following solutions best addresses the reported vulnerabilities?

- A. Using IaC to include the newest dependencies
- B. Creating a bug bounty program
- C. Implementing a continuous security assessment program
- D. Integrating a SAST tool as part of the pipeline

Answer: D

Explanation:

The best solution to address reported vulnerabilities in third-party libraries is integrating a Static Application Security Testing (SAST) tool as part of the development pipeline. Here's why:

- ? Early Detection: SAST tools analyze source code for vulnerabilities before the code is compiled. This allows developers to identify and fix security issues early in the development process.
- ? Continuous Security: By integrating SAST tools into the CI/CD pipeline, the organization ensures continuous security assessment of the codebase, including third-party libraries, with each code commit and build.
- ? Comprehensive Analysis: SAST tools provide a detailed analysis of the code, identifying potential vulnerabilities in both proprietary code and third-party dependencies, ensuring that known issues in libraries are addressed promptly.
- ? References:

NEW QUESTION 61

A financial services organization is using AI to fully automate the process of deciding client loan rates. Which of the following should the organization be most concerned about from a privacy perspective?

- A. Model explainability
- B. Credential Theft
- C. Possible prompt Injections
- D. Exposure to social engineering

Answer: A

Explanation:

When using AI to fully automate the process of deciding client loan rates, the primary concern from a privacy perspective is model explainability.

Why Model Explainability is Critical:

- ? Transparency: It ensures that the decision-making process of the AI model can be understood and explained to stakeholders, including clients.
 - ? Accountability: Helps in identifying biases and errors in the model, ensuring that the AI is making fair and unbiased decisions.
 - ? Regulatory Compliance: Various regulations require that decisions, especially those affecting individuals' financial status, can be explained and justified.
 - ? Trust: Builds trust among users and stakeholders by demonstrating that the AI decisions are transparent and justifiable.
- Other options, such as credential theft, prompt injections, and social engineering, are significant concerns but do not directly address the privacy and fairness implications of automated decision-making.

References:

- ? CompTIA SecurityX Study Guide
- ? "The Importance of Explainability in AI," IEEE Xplore
- ? GDPR Article 22, "Automated Individual Decision-Making, Including Profiling"

NEW QUESTION 64

An organization is required to

- * Respond to internal and external inquiries in a timely manner
- * Provide transparency.
- * Comply with regulatory requirements

The organization has not experienced any reportable breaches but wants to be prepared if a breach occurs in the future. Which of the following is the best way for the organization to prepare?

- A. Outsourcing the handling of necessary regulatory filing to an external consultant
- B. Integrating automated response mechanisms into the data subject access request process
- C. Developing communication templates that have been vetted by internal and external counsel
- D. Conducting lessons-learned activities and integrating observations into the crisis management plan

Answer: C

Explanation:

Preparing communication templates that have been vetted by both internal and external counsel ensures that the organization can respond quickly and effectively to internal and external inquiries, comply with regulatory requirements, and provide transparency in the event of a breach.

Why Communication Templates?

- ? Timely Response: Pre-prepared templates ensure that responses are ready to be deployed quickly, reducing response time.
- ? Regulatory Compliance: Templates vetted by counsel ensure that all communications meet legal and regulatory requirements.
- ? Consistent Messaging: Ensures that all responses are consistent, clear, and accurate, maintaining the organization's credibility.
- ? Crisis Management: Pre-prepared templates are a critical component of a broader crisis management plan, ensuring that all stakeholders are informed appropriately.

Other options, while useful, do not provide the same level of preparedness and compliance:

- ? A. Outsourcing to an external consultant: This may delay response times and lose internal control over the communication.
- ? B. Integrating automated response mechanisms: Useful for efficiency but not for ensuring compliant and vetted responses.
- ? D. Conducting lessons-learned activities: Important for improving processes but does not provide immediate preparedness for communication.

References:

- ? CompTIA SecurityX Study Guide
- ? NIST Special Publication 800-61 Revision 2, "Computer Security Incident Handling Guide"
- ? ISO/IEC 27002:2013, "Information technology — Security techniques — Code of practice for information security controls"

NEW QUESTION 69

A vulnerability can on a web server identified the following:

```
* TLS 1.2 Cipher Suites:
The server accepted the following 4 cipher suites:
TLS_RSA_WITH_DES_CBC_SHA          56
TLS_RSA_WITH_AES_128_CBC_SHA      128
TLS_RSA_WITH_3DES_EDE_CBC_SHA     168
TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA 168 DH (1024 bits)
```

Which of the following actions would most likely eliminate on path decryption attacks? (Select two).

- A. Disallowing cipher suites that use ephemeral modes of operation for key agreement
- B. Removing support for CBC-based key exchange and signing algorithms
- C. Adding TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA256
- D. Implementing HIPS rules to identify and block BEAST attack attempts
- E. Restricting cipher suites to only allow TLS_RSA_WITH_AES_128_CBC_SHA
- F. Increasing the key length to 256 for TLS_RSA_WITH_AES_128_CBC_SHA

Answer: BC

Explanation:

On-path decryption attacks, such as BEAST (Browser Exploit Against SSL/TLS) and other related vulnerabilities, often exploit weaknesses in the implementation of CBC (Cipher Block Chaining) mode. To mitigate these attacks, the following actions are recommended:

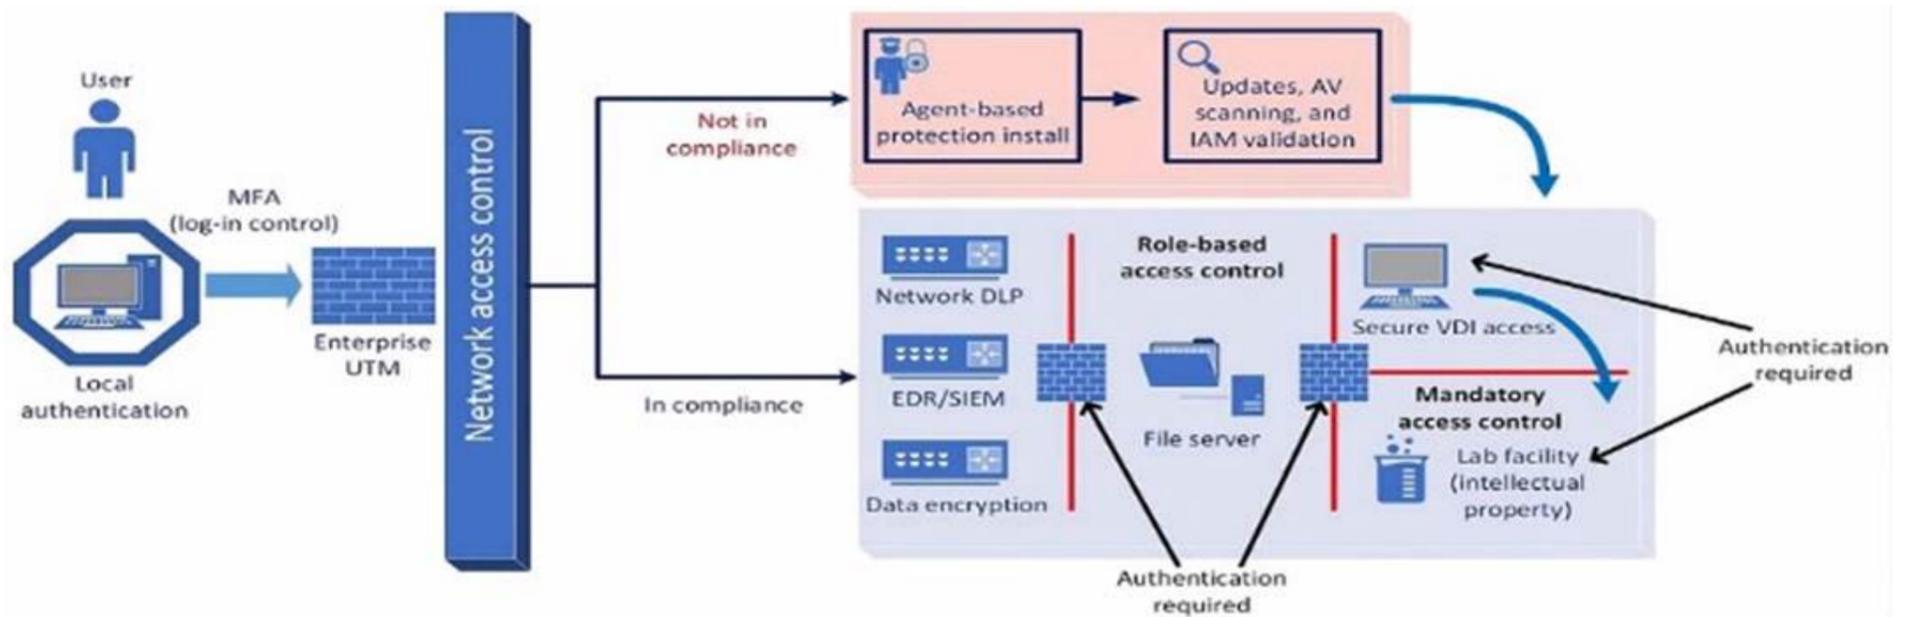

- ? B. Removing support for CBC-based key exchange and signing algorithms: CBC mode is vulnerable to certain attacks like BEAST. By removing support for CBC- based ciphers, you can eliminate one of the primary vectors for these attacks. Instead, use modern cipher modes like GCM (Galois/Counter Mode) which offer better security properties.
- ? C. Adding TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA256: This cipher suite uses Elliptic Curve Diffie-Hellman Ephemeral (ECDHE) for key exchange, which provides perfect forward secrecy. It also uses AES in GCM mode, which is not susceptible to the same attacks as CBC. SHA-256 is a strong hash function that ensures data integrity.

References:

- ? CompTIA Security+ Study Guide
- ? NIST SP 800-52 Rev. 2, "Guidelines for the Selection, Configuration, and Use of Transport Layer Security (TLS) Implementations"
- ? OWASP (Open Web Application Security Project) guidelines on cryptography and secure communication

NEW QUESTION 72

A company plans to implement a research facility with Intellectual property data that should be protected The following is the security diagram proposed by the security architect

Which of the following security architect models is illustrated by the diagram?

- A. Identity and access management model
- B. Agent based security model
- C. Perimeter protection security model
- D. Zero Trust security model

Answer: D

Explanation:

The security diagram proposed by the security architect depicts a Zero Trust security model. Zero Trust is a security framework that assumes all entities, both inside and outside the network, cannot be trusted and must be verified before gaining access to resources.

Key Characteristics of Zero Trust in the Diagram:

- ? Role-based Access Control: Ensures that users have access only to the resources necessary for their role.
- ? Mandatory Access Control: Additional layer of security requiring authentication for access to sensitive areas.
- ? Network Access Control: Ensures that devices meet security standards before accessing the network.
- ? Multi-factor Authentication (MFA): Enhances security by requiring multiple forms of verification.

This model aligns with the Zero Trust principles of never trusting and always verifying access requests, regardless of their origin.

References:

- ? CompTIA SecurityX Study Guide
- ? NIST Special Publication 800-207, "Zero Trust Architecture"
- ? "Implementing a Zero Trust Architecture," Forrester Research

NEW QUESTION 75

A systems administrator works with engineers to process and address vulnerabilities as a result of continuous scanning activities. The primary challenge faced by the administrator is differentiating between valid and invalid findings. Which of the following would the systems administrator most likely verify is properly configured?

- A. Report retention time
- B. Scanning credentials
- C. Exploit definitions
- D. Testing cadence

Answer: B

Explanation:

When differentiating between valid and invalid findings from vulnerability scans, the systems administrator should verify that the scanning credentials are properly configured. Valid credentials ensure that the scanner can authenticate and access the systems being evaluated, providing accurate and comprehensive results. Without proper credentials, scans may miss vulnerabilities or generate false positives, making it difficult to prioritize and address the findings effectively.

References:

- ? CompTIA SecurityX Study Guide: Highlights the importance of using valid credentials for accurate vulnerability scanning.
- ? "Vulnerability Management" by Park Foreman: Discusses the role of scanning credentials in obtaining accurate scan results and minimizing false positives.
- ? "The Art of Network Security Monitoring" by Richard Bejtlich: Covers best practices for configuring and using vulnerability scanning tools, including the need for valid credentials.

NEW QUESTION 78

A company that relies on an COL system must keep it operating until a new solution is available Which of the following is the most secure way to meet this goal?

- A. Isolating the system and enforcing firewall rules to allow access to only required endpoints
- B. Enforcing strong credentials and improving monitoring capabilities
- C. Restricting system access to perform necessary maintenance by the IT team
- D. Placing the system in a screened subnet and blocking access from internal resources

Answer: A

Explanation:

To ensure the most secure way of keeping a legacy system (COL) operating until a new solution is available, isolating the system and enforcing strict firewall rules is the best approach. This method minimizes the attack surface by restricting access to only the necessary endpoints, thereby reducing the risk of unauthorized access and potential security breaches. Isolating the system ensures that it is not exposed to the broader network, while firewall rules control the traffic that can reach the system, providing a secure environment until a replacement is implemented.

References:

- ? CompTIA SecurityX Study Guide: Recommends network isolation and firewall rules as effective measures for securing legacy systems.

? NIST Special Publication 800-82, "Guide to Industrial Control Systems (ICS) Security": Advises on isolating critical systems and using firewalls to control access.
 ? "Network Security Assessment" by Chris McNab: Discusses techniques for isolating systems and enforcing firewall rules to protect vulnerable or legacy systems.
 By isolating the system and implementing strict firewall controls, the organization can maintain the necessary operations securely while working on deploying a new solution.

NEW QUESTION 80

A security analyst is reviewing the following event timeline from an COR solution:

Time	File name	File action	Action verdict
4:08 p.m.	hr-reporting.docx	File save	Allowed
4:09 p.m.	hr-reporting.docx	Scan initiated	Pending
4:10 p.m.	hr-reporting.docx	File execute	Allowed
4:16 p.m.	paychecks.xlsx	File save	Allowed
4:16 p.m.	paychecks.xlsx	File shared	Allowed
4:17 p.m.	hr-reporting.docx	Script launched	Allowed
4:19 p.m.	hr-reporting.docx	Scan complete	Malware found
4:20 p.m.	paychecks.xlsx	File edit	Allowed

Which of the following most likely has occurred and needs to be fixed?

- A. The DI P has failed to block malicious exfiltration and data tagging is not being utilized property
- B. An EDR bypass was utilized by a threat actor and updates must be installed by the administrator.
- C. A logic law has introduced a TOCTOU vulnerability and must be addressed by the COR vendor
- D. A potential insider threat is being investigated and will be addressed by the senior management team.

Answer: C

Explanation:

The event timeline indicates a sequence where a file (hr-reporting.docx) was saved, scanned, executed, and eventually found to contain malware. The critical issue here is that the malware scan completed after the file was already executed. This suggests a Time-Of- Check to Time-Of-Use (TOCTOU) vulnerability, where the state of the file changed between the time it was checked and the time it was used.

References:

- ? CompTIA SecurityX Study Guide: Discusses TOCTOU vulnerabilities as a timing attack where the state of a resource changes after it has been validated.
- ? NIST Special Publication 800-53, "Security and Privacy Controls for Federal Information Systems and Organizations": Recommends addressing TOCTOU vulnerabilities to ensure the integrity of security operations.
- ? "The Art of Software Security Assessment" by Mark Dowd, John McDonald, and Justin Schuh: Covers logic flaws and timing vulnerabilities, including TOCTOU issues.

NEW QUESTION 82

A security professional is investigating a trend in vulnerability findings for newly deployed cloud systems Given the following output:

Date	IP address	System name	Finding	Criticality rating
10/13/2023	10.123.34.98	System1	OpenSSL version 1.01	Medium
10/13/2023	10.3.114.72	System6	OpenSSL version 1.01	Medium
10/13/2023	10.12.134.45	System12	Java 11 runtime environment found	Medium
10/13/2023	10.68.65.11	System36	OpenSSL version 1.01	Medium
10/13/2023	10.23.74.9	System37	Java 11 runtime environment found	Medium
10/13/2023	10.13.124.3	System45	OpenSSL version 1.01	Medium

Which of the following actions would address the root cause of this issue?

- A. Automating the patching system to update base Images
- B. Recompiling the affected programs with the most current patches
- C. Disabling unused/unneeded ports on all servers
- D. Deploying a WAF with virtual patching upstream of the affected systems

Answer: A

Explanation:

The output shows that multiple systems have outdated or vulnerable software versions (OpenSSL 1.01 and Java 11 runtime). This suggests that the systems are not being patched regularly or effectively.

- ? A. Automating the patching system to update base images: Automating the patching process ensures that the latest security updates and patches are applied to all systems, including newly deployed ones. This addresses the root cause by ensuring that base images used for deployment are always up-to-date with the latest security patches.
- ? B. Recompiling the affected programs with the most current patches: While this can fix the immediate vulnerabilities, it does not address the root cause of the problem, which is the lack of regular updates.

- ? C. Disabling unused/unneeded ports on all servers: This improves security but does not address the specific issue of outdated software.
 - ? D. Deploying a WAF with virtual patching upstream of the affected systems: This can provide a temporary shield but does not resolve the underlying issue of outdated software.
- Automating the patching system to update base images ensures that all deployed systems are using the latest, most secure versions of software, addressing the root cause of the vulnerability trend.
- References:
- ? CompTIA Security+ Study Guide
 - ? NIST SP 800-40 Rev. 3, "Guide to Enterprise Patch Management Technologies"
 - ? CIS Controls, "Control 7: Continuous Vulnerability Management"

NEW QUESTION 85

A security analyst needs to ensure email domains that send phishing attempts without previous communications are not delivered to mailboxes. The following email headers are being reviewed:

Date	Sending domain	Reply-to domain	Subject
April 16	sales.com	sales-mail.com	Updated Security Questions
April 18	vendor.com	vendor.com	New Sales Catalog
April 18	partner.com	partner.com	B2B Sales Increase
April 19	hr-saas.com	hr-saas.com	Employee Payroll Update Request
April 19	vendor.com	vendor.com	Password Requirements Not Met

Which of the following is the best action for the security analyst to take?

- A. Block messages from hr-saas.com because it is not a recognized domain.
- B. Reroute all messages with unusual security warning notices to the IT administrator.
- C. Quarantine all messages with sales-mail.com in the email header.
- D. Block vendor.com for repeated attempts to send suspicious messages.

Answer: D

Explanation:

In reviewing email headers and determining actions to mitigate phishing attempts, the security analyst should focus on patterns of suspicious behavior and the reputation of the sending domains. Here's the analysis of the options provided:

- * A. Block messages from hr-saas.com because it is not a recognized domain: Blocking a domain solely because it is not recognized can lead to legitimate emails being missed. Recognition alone should not be the criterion for blocking.
- * B. Reroute all messages with unusual security warning notices to the IT administrator: While rerouting suspicious messages can be a good practice, it is not specific to the domain sending repeated suspicious messages.
- * C. Quarantine all messages with sales-mail.com in the email header: Quarantining messages based on the presence of a specific domain in the email header can be too broad and may capture legitimate emails.
- * D. Block vendor.com for repeated attempts to send suspicious messages: This option is the most appropriate because it targets a domain that has shown a pattern of sending suspicious messages. Blocking a domain that repeatedly sends phishing attempts without previous communications helps in preventing future attempts from the same source and aligns with the goal of mitigating phishing risks.

References:

- ? CompTIA SecurityX Study Guide: Details best practices for handling phishing attempts, including blocking domains with repeated suspicious activity.
 - ? NIST Special Publication 800-45 Version 2, "Guidelines on Electronic Mail Security": Provides guidelines on email security, including the management of suspicious email domains.
 - ? "Phishing and Countermeasures: Understanding the Increasing Problem of Electronic Identity Theft" by Markus Jakobsson and Steven Myers: Discusses effective measures to counter phishing attempts, including blocking persistent offenders.
- By blocking the domain that has consistently attempted to send suspicious messages, the security analyst can effectively reduce the risk of phishing attacks.

NEW QUESTION 86

After an incident occurred, a team reported during the lessons-learned review that the team:

- * Lost important information for further analysis.
- * Did not utilize the chain of communication.
- * Did not follow the right steps for a proper response.

Which of the following solutions is the best way to address these findings?

- A. Requesting budget for better forensic tools to improve technical capabilities for incident response operations.
- B. Building playbooks for different scenarios and performing regular table-top exercises.
- C. Requiring professional incident response certifications for each new team member.
- D. Publishing the incident response policy and enforcing it as part of the security awareness program.

Answer: B

Explanation:

Building playbooks for different scenarios and performing regular table-top exercises directly addresses the issues identified in the lessons-learned review. Here's why:

- ? Lost important information for further analysis: Playbooks outline step-by-step procedures for incident response, ensuring that team members know exactly what to document and how to preserve evidence.
- ? Did not utilize the chain of communication: Playbooks include communication protocols, specifying who to notify and when. Regular table-top exercises reinforce these communication channels, ensuring they are followed during actual incidents.
- ? Did not follow the right steps for a proper response: Playbooks provide a clear sequence of actions to be taken during various types of incidents, helping the team to respond in a structured and effective manner. Regular exercises allow the team to practice these steps, identifying and correcting any deviations from the plan.

Investing in better forensic tools (Option A) or requiring certifications (Option C) are also valuable, but they do not directly address the procedural and communication gaps identified. Publishing and enforcing the incident response policy (Option D) is important but not as practical and hands-on as playbooks and

exercises in ensuring the team is prepared.

References:

- ? CompTIA Security+ Study Guide
- ? NIST SP 800-61 Rev. 2, "Computer Security Incident Handling Guide"
- ? SANS Institute, "Incident Handler's Handbook"

NEW QUESTION 90

Which of the following best describes the challenges associated with widespread adoption of homomorphic encryption techniques?

- A. Incomplete mathematical primitives
- B. No use cases to drive adoption
- C. Quantum computers not yet capable
- D. insufficient coprocessor support

Answer: D

Explanation:

Homomorphic encryption allows computations to be performed on encrypted data without decrypting it, providing strong privacy guarantees. However, the adoption of homomorphic encryption is challenging due to several factors:

? A. Incomplete mathematical primitives: This is not the primary barrier as the theoretical foundations of homomorphic encryption are well-developed.

? B. No use cases to drive adoption: There are several compelling use cases for homomorphic encryption, especially in privacy-sensitive fields like healthcare and finance.

? C. Quantum computers not yet capable: Quantum computing is not directly related to the challenges of adopting homomorphic encryption.

? D. Insufficient coprocessor support: The computational overhead of homomorphic encryption is significant, requiring substantial processing power. Current general-purpose processors are not optimized for the intensive computations required by homomorphic encryption, limiting its practical deployment. Specialized hardware or coprocessors designed to handle these computations more efficiently are not yet widely available.

References:

- ? CompTIA Security+ Study Guide
- ? "Homomorphic Encryption: Applications and Challenges" by Rivest et al.
- ? NIST, "Report on Post-Quantum Cryptography"

NEW QUESTION 95

After remote desktop capabilities were deployed in the environment, various vulnerabilities were noticed.

- Exfiltration of intellectual property
- Unencrypted files
- Weak user passwords

Which of the following is the best way to mitigate these vulnerabilities? (Select two).

- A. Implementing data loss prevention
- B. Deploying file integrity monitoring
- C. Restricting access to critical file services only
- D. Deploying directory-based group policies
- E. Enabling modern authentication that supports MFA
- F. Implementing a version control system
- G. Implementing a CMDB platform

Answer: AE

Explanation:

To mitigate the identified vulnerabilities, the following solutions are most appropriate:

? A. Implementing data loss prevention (DLP): DLP solutions help prevent the unauthorized transfer of data outside the organization. This directly addresses the exfiltration of intellectual property by monitoring, detecting, and blocking sensitive data transfers.

? E. Enabling modern authentication that supports Multi-Factor Authentication

(MFA): This significantly enhances security by requiring additional verification methods beyond just passwords. It addresses the issue of weak user passwords by making it much harder for unauthorized users to gain access, even if they obtain the password.

Other options, while useful in specific contexts, do not address all the vulnerabilities mentioned:

? B. Deploying file integrity monitoring helps detect changes to files but does not prevent data exfiltration or address weak passwords.

? C. Restricting access to critical file services improves security but is not comprehensive enough to mitigate all identified vulnerabilities.

? D. Deploying directory-based group policies can enforce security policies but might not directly prevent data exfiltration or ensure strong authentication.

? F. Implementing a version control system helps manage changes to files but is not a security measure for preventing the identified vulnerabilities.

? G. Implementing a CMDB platform (Configuration Management Database) helps manage IT assets but does not address the specific security issues mentioned.

References:

- ? CompTIA Security+ Study Guide
- ? NIST SP 800-53 Rev. 5, "Security and Privacy Controls for Information Systems and Organizations"
- ? CIS Controls, "Control 13: Data Protection" and "Control 16: Account Monitoring and Control"

NEW QUESTION 96

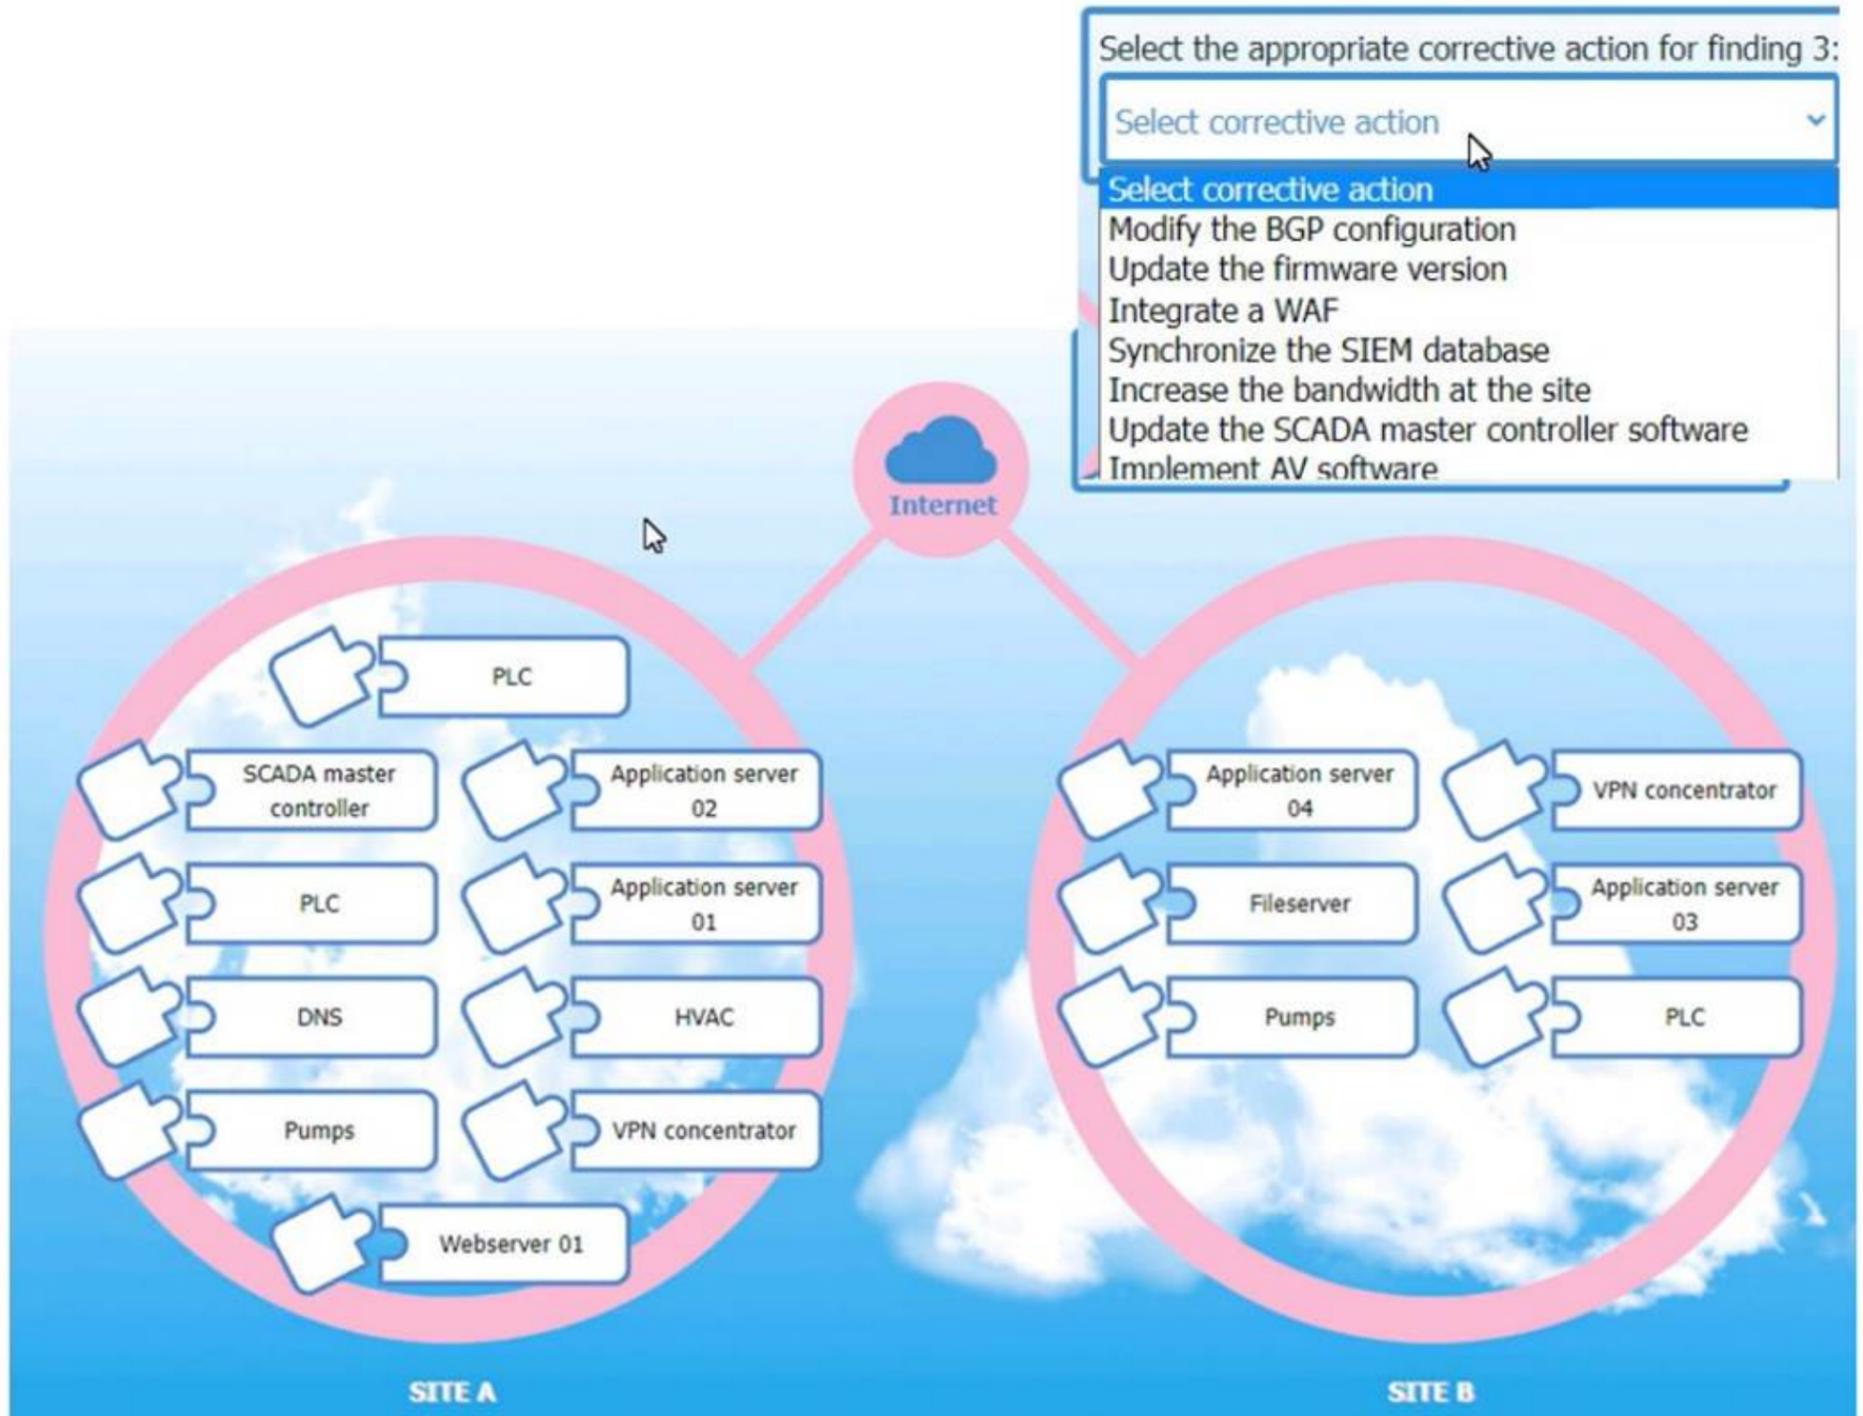

SIMULATION

An organization is planning for disaster recovery and continuity of operations, and has noted the following relevant findings:

- * 1. A natural disaster may disrupt operations at Site A, which would then cause an evacuation. Users are unable to log into the domain from their workstations after relocating to Site B.
- * 2. A natural disaster may disrupt operations at Site A, which would then cause the pump room at Site B to become inoperable.
- * 3. A natural disaster may disrupt operations at Site A, which would then cause unreliable internet connectivity at Site B due to route flapping.

INSTRUCTIONS

Match each relevant finding to the affected host by clicking on the host name and selecting the appropriate number.
 For findings 1 and 2, select the items that should be replicated to Site B. For finding 3, select the item requiring configuration changes, then select the appropriate corrective action from the drop-down menu.

Relevant findings

- 1** A natural disaster may disrupt operations at Site A, which would then cause an evacuation. Users are unable to log into the domain from their workstations after relocating to Site B.
 Select this for the item that should be replicated to Site B.
- 2** A natural disaster may disrupt operations at Site A, which would then cause the pump room at Site B to become inoperable.
 Select this for the item that should be replicated to Site B.
- 3** A natural disaster may disrupt operations at Site A, which would then cause unreliable Internet connectivity at Site B due to route flapping.
 Select this for the item requiring configuration changes.

A. Mastered
 B. Not Mastered

Answer: A

Explanation:

Matching Relevant Findings to the Affected Hosts:

? Finding 1:

? Finding 2:

? Finding 3:

Corrective Actions for Finding 3:

? Finding 3 Corrective Action:

? Replication to Site B for Finding 1:

? Replication to Site B for Finding 2:

? Configuration Changes for Finding 3:

References:

? CompTIA Security+ Study Guide: This guide provides detailed information on disaster recovery and continuity of operations, emphasizing the importance of replicating critical services and making necessary configuration changes to ensure seamless operation during disruptions.

? CompTIA Security+ Exam Objectives: These objectives highlight key areas in disaster recovery planning, including the replication of critical services and network configuration adjustments.

? Disaster Recovery and Business Continuity Planning (DRBCP): This resource outlines best practices for ensuring that operations can continue at an alternate site during a disaster, including the replication of essential services and network stability measures.

By ensuring that critical services like DNS and control systems for pumps are replicated at the alternate site, and by addressing network routing issues through proper BGP configuration, the organization can maintain operational continuity and minimize the impact of natural disasters on their operations.

NEW QUESTION 100

A security administrator is performing a gap assessment against a specific OS benchmark. The benchmark requires the following configurations be applied to endpoints:

- Full disk encryption
- * Host-based firewall
- Time synchronization
- * Password policies
- Application allow listing
- * Zero Trust application access

Which of the following solutions best addresses the requirements? (Select two).

- A. CASB
- B. SBoM
- C. SCAP
- D. SASE
- E. HIDS

Answer: CD

Explanation:

To address the specific OS benchmark configurations, the following solutions are most appropriate:

* C. SCAP (Security Content Automation Protocol): SCAP helps in automating vulnerability management and policy compliance, including configurations like full disk encryption, host-based firewalls, and password policies.

* D. SASE (Secure Access Service Edge): SASE provides a framework for Zero Trust network access and application allow listing, ensuring secure and compliant access to applications and data.

These solutions together cover the comprehensive security requirements specified in the OS benchmark, ensuring a robust security posture for endpoints.

References:

? CompTIA SecurityX Study Guide: Discusses SCAP and SASE as part of security configuration management and Zero Trust architectures.

? NIST Special Publication 800-126, "The Technical Specification for the Security Content Automation Protocol (SCAP)": Details SCAP's role in security automation.

? "Zero Trust Networks: Building Secure Systems in Untrusted Networks" by Evan Gilman and Doug Barth: Covers the principles of Zero Trust and how SASE can implement them.

By implementing SCAP and SASE, the organization ensures that all the specified security configurations are applied and maintained effectively.

NEW QUESTION 102

An organization wants to manage specialized endpoints and needs a solution that provides the ability to

- * Centrally manage configurations
- * Push policies.
- Remotely wipe devices
- Maintain asset inventory

Which of the following should the organization do to best meet these requirements?

- A. Use a configuration management database
- B. Implement a mobile device management solution.
- C. Configure contextual policy management
- D. Deploy a software asset manager

Answer: B

Explanation:

To meet the requirements of centrally managing configurations, pushing policies, remotely wiping devices, and maintaining an asset inventory, the best solution is to implement a Mobile Device Management (MDM) solution.

MDM Capabilities:

? Central Management: MDM allows administrators to manage the configurations of all devices from a central console.

? Policy Enforcement: MDM solutions enable the push of security policies and updates to ensure compliance across all managed devices.

? Remote Wipe: In case a device is lost or stolen, MDM provides the capability to remotely wipe the device to protect sensitive data.

? Asset Inventory: MDM maintains an up-to-date inventory of all managed devices, including their configurations and installed applications.

Other options do not provide the same comprehensive capabilities required for managing specialized endpoints.

References:

- ? CompTIA SecurityX Study Guide
- ? NIST Special Publication 800-124 Revision 1, "Guidelines for Managing the Security of Mobile Devices in the Enterprise"
- ? "Mobile Device Management Overview," Gartner Research

NEW QUESTION 106

A security analyst is troubleshooting the reason a specific user is having difficulty accessing company resources. The analyst reviews the following information:

User	Source IP	Source location	User assigned location	MFA satisfied?	Sign-in status
SALES1	8.11.4.16	Germany	France	Yes	Blocked
SALES1	8.11.4.16	Germany	France	Yes	Blocked
ACCT1	192.168.4.18	France	France	No	Allowed
SALES1	8.11.4.16	Germany	France	Yes	Blocked
ACCT1	8.11.4.16	Germany	France	Yes	Blocked
SALES2	8.11.4.20	France	France	Yes	Allowed

Which of the following is most likely the cause of the issue?

- A. The local network access has been configured to bypass MFA requirements.
- B. A network geolocation is being misidentified by the authentication server.
- C. Administrator access from an alternate location is blocked by company policy.
- D. Several users have not configured their mobile devices to receive OTP codes.

Answer: B

Explanation:

The table shows that the user "SALES1" is consistently blocked despite having met the MFA requirements. The common factor in these blocked attempts is the source IP address (8.11.4.16) being identified as from Germany while the user is assigned to France. This discrepancy suggests that the network geolocation is being misidentified by the authentication server, causing legitimate access attempts to be blocked.

Why Network Geolocation Misidentification?

? **Geolocation Accuracy:** Authentication systems often use IP geolocation to verify the location of access attempts. Incorrect geolocation data can lead to legitimate requests being denied if they appear to come from unexpected locations.

? **Security Policies:** Company security policies might block access attempts from certain locations to prevent unauthorized access. If the geolocation is wrong, legitimate users can be inadvertently blocked.

? **Consistent Pattern:** The user "SALES1" from the IP address 8.11.4.16 is always blocked, indicating a consistent issue with geolocation.

Other options do not align with the pattern observed:

- ? **A. Bypass MFA requirements:** MFA is satisfied, so bypassing MFA is not the issue.
- ? **C. Administrator access policy:** This is about user access, not specific administrator access.
- ? **D. OTP codes:** The user has satisfied MFA, so OTP code configuration is not the issue.

References:

- ? CompTIA SecurityX Study Guide
- ? "Geolocation and Authentication," NIST Special Publication 800-63B
- ? "IP Geolocation Accuracy," Cisco Documentation

NEW QUESTION 109

All organization is concerned about insider threats from employees who have individual access to encrypted material. Which of the following techniques best addresses this issue?

- A. SSO with MFA
- B. Salting and hashing
- C. Account federation with hardware tokens
- D. SAE
- E. Key splitting

Answer: E

Explanation:

The technique that best addresses the issue of insider threats from employees who have individual access to encrypted material is key splitting. Here's why:

? **Key Splitting:** Key splitting involves dividing a cryptographic key into multiple parts and distributing these parts among different individuals or systems. This ensures that no single individual has complete access to the key, thereby mitigating the risk of insider threats.

? **Increased Security:** By requiring multiple parties to combine their key parts to access encrypted material, key splitting provides an additional layer of security. This approach is particularly useful in environments where sensitive data needs to be protected from unauthorized access by insiders.

? **Compliance and Best Practices:** Key splitting aligns with best practices and regulatory requirements for handling sensitive information, ensuring that access is tightly controlled and monitored.

? References:

By employing key splitting, organizations can effectively reduce the risk of insider threats and enhance the overall security of encrypted material.

NEW QUESTION 112

A hospital provides tablets to its medical staff to enable them to more quickly access and edit patients' charts. The hospital wants to ensure that if a tablet is identified as lost or stolen and a remote command is issued, the risk of data loss can be mitigated within seconds. The tablets are configured as follows to meet hospital policy:

- Full disk encryption is enabled
- "Always On" corporate VPN is enabled
- ef-use-backed keystore is enabled/ready.
- Wi-Fi 6 is configured with SAE.

- Location services is disabled.
 - Application allow list is configured
- A. Revoking the user certificates used for VPN and Wi-Fi access
 B. Performing cryptographic obfuscation
 C. Using geolocation to find the device
 D. Configuring the application allow list to only per mil emergency calls
 E. Returning on the device's solid-state media to zero

Answer: E

Explanation:

To mitigate the risk of data loss on a lost or stolen tablet quickly, the most effective strategy is to return the device's solid-state media to zero, which effectively erases all data on the device. Here's why:

? Immediate Data Erasure: Returning the solid-state media to zero ensures that all data is wiped instantly, mitigating the risk of data loss if the device is lost or stolen.

? Full Disk Encryption: Even though the tablets are already encrypted, physically erasing the data ensures that no residual data can be accessed if someone attempts to bypass encryption.

? Compliance and Security: This method adheres to best practices for data security and compliance, ensuring that sensitive patient data cannot be accessed by unauthorized parties.

NEW QUESTION 116

A security analyst wants to use lessons learned from a poor incident response to reduce dwell time in the future. The analyst is using the following data points

User	Site visited	HTTP method	Filter status	Traffic status	Alert status
account1	tools.com	GET	Allowed	Allowed	No
admin1	hacking.com	GET	Allowed	Allowed	Yes
account5	payroll.com	GET	Allowed	Allowed	No
account2	p4yr0ll.com	GET	Blocked	Blocked	No
account2	p4yr0ll.com	POST	Blocked	Blocked	No
account2	139.40.29.21	POST	Allowed	Allowed	No
account5	payroll.com	GET	Allowed	Allowed	No

Which of the following would the analyst most likely recommend?

- A. Adjusting the SIEM to alert on attempts to visit phishing sites
- B. Allowing TRACE method traffic to enable better log correlation
- C. Enabling alerting on all suspicious administrator behavior
- D. Utilizing allow lists on the WAF for all users using GET methods

Answer: C

Explanation:

In the context of improving incident response and reducing dwell time, the security analyst needs to focus on proactive measures that can quickly detect and alert on potential security breaches. Here's a detailed analysis of the options provided:

* A. Adjusting the SIEM to alert on attempts to visit phishing sites: While this is a useful measure to prevent phishing attacks, it primarily addresses external threats and doesn't directly impact dwell time reduction, which focuses on the time a threat remains undetected within a network.

* B. Allowing TRACE method traffic to enable better log correlation: The TRACE method in HTTP is used for debugging purposes, but enabling it can introduce security vulnerabilities. It's not typically recommended for enhancing security monitoring or incident response.

* C. Enabling alerting on all suspicious administrator behavior: This option directly targets the potential misuse of administrator accounts, which are often high-value targets for attackers. By monitoring and alerting on suspicious activities from admin accounts, the organization can quickly identify and respond to potential breaches, thereby reducing dwell time significantly. Suspicious behavior could include unusual login times, access to sensitive data not usually accessed by the admin, or any deviation from normal behavior patterns. This proactive monitoring is crucial for quick detection and response, aligning well with best practices in incident response.

* D. Utilizing allow lists on the WAF for all users using GET methods: This measure is aimed at restricting access based on allowed lists, which can be effective in preventing unauthorized access but doesn't specifically address the need for quick detection and response to internal threats.

References:

? CompTIA SecurityX Study Guide: Emphasizes the importance of monitoring and alerting on admin activities as part of a robust incident response plan.

? NIST Special Publication 800-61 Revision 2, "Computer Security Incident Handling Guide": Highlights best practices for incident response, including the importance of detecting and responding to suspicious activities quickly.

? "Incident Response & Computer Forensics" by Jason T. Luttgens, Matthew Pepe, and Kevin Mandia: Discusses techniques for reducing dwell time through effective monitoring and alerting mechanisms, particularly focusing on privileged account activities.

By focusing on enabling alerting for suspicious administrator behavior, the security analyst addresses a critical area that can help reduce the time a threat goes undetected, thereby improving the overall security posture of the organization.

Top of Form Bottom of Form

NEW QUESTION 118

SIMULATION

A product development team has submitted code snippets for review prior to release. INSTRUCTIONS

Analyze the code snippets, and then select one vulnerability, and one fix for each code snippet.

Code Snippet 1

Code Snippet 1

Code Snippet 2

Web browser:

URL: <https://comptia.org/profiles/userdetails?userid=103>

Web server code:

```
--
String accountQuery = "SELECT * from users WHERE userid = ?";
PreparedStatement stmt = connection.prepareStatement(accountQuery);
stmt.setString(1, request.getParameter("userid"));
ResultSet queryResponse = stmt.executeQuery();
--
```

Code Snippet 2

```
Caller:
URL: https://comptia.org/api/userprofile?userid=103

API endpoint (/searchDirectory):
...
import subprocess
from http.server import HTTPServer, BaseHTTPRequestHandler
httpd = HTTPServer(('192.168.0.5', 8443), BaseHTTPRequestHandler)
httpd.serve_forever()

def get_request(request):
    userId = request.getParam('userid')

    ldapLookup = 'ldapsearch -D "cn=' + userId + '" -W -p 389
                  -h loginserver.comptia.org
                  -b "dc=comptia,dc=org" -s sub -x "(objectclass=*)"'
    accountLookup = subprocess.Popen(ldapLookup)

    if (userExists(accountLookup))
        accountFound = true
    else
        accountFound = false
    ...
```

Vulnerability 1:

- ? SQL injection
- ? Cross-site request forgery
- ? Server-side request forgery
- ? Indirect object reference
- ? Cross-site scripting

Fix 1:

- ? Perform input sanitization of the userid field.
- ? Perform output encoding of queryResponse,
- ? Ensure usex:ia belongs to logged-in user.
- ? Inspect URLs and disallow arbitrary requests.
- ? Implement anti-forgery tokens.

Vulnerability 2

- 1) Denial of service
- 2) Command injection
- 3) SQL injection
- 4) Authorization bypass
- 5) Credentials passed via GET

Fix 2

- A) Implement prepared statements and bind variables.
- B) Remove the serve_forever instruction.
- C) Prevent the "authenticated" value from being overridden by a GET parameter.
- D) HTTP POST should be used for sensitive parameters.
- E) Perform input sanitization of the userid field.

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Code Snippet 1

Vulnerability 1: SQL injection

SQL injection is a type of attack that exploits a vulnerability in the code that interacts with a database. An attacker can inject malicious SQL commands into the input fields, such as username or password, and execute them on the database server. This can result in data theft, data corruption, or unauthorized access.

Fix 1: Perform input sanitization of the userid field.

Input sanitization is a technique that prevents SQL injection by validating and filtering the user input values before passing them to the database. The input sanitization should remove any special characters, such as quotes, semicolons, or dashes, that can alter the intended SQL query. Alternatively, the input sanitization can use a whitelist of allowed values and reject any other values.

Code Snippet 2

Vulnerability 2: Cross-site request forgery

Cross-site request forgery (CSRF) is a type of attack that exploits a vulnerability in the code that handles web requests. An attacker can trick a user into sending a malicious web request to a server that performs an action on behalf of the user, such as changing their password, transferring funds, or deleting data. This can result in unauthorized actions, data loss, or account compromise.

Fix 2: Implement anti-forgery tokens.

Anti-forgery tokens are techniques that prevent CSRF by adding a unique and secret value to each web request that is generated by the server and verified by the server before performing the action. The anti-forgery token should be different for each user and each session, and should not be predictable or reusable by an attacker. This way, only legitimate web requests from the user's browser can be accepted by the server.

NEW QUESTION 122

A senior security engineer flags me following log file snippet as having likely facilitated an attacker's lateral movement in a recent breach:

```
[log.txt]
...
qry_source: 19.27.214.22 TCP/53
qry_dest: 199.105.22.13 TCP/53
qry_type: AXFR
| in comptia.org
-----| directoryserver1 A 10.80.8.10
-----| directoryserver2 A 10.80.8.11
-----| directoryserver3 A 10.80.8.12
-----| internal-dns A 10.80.9.1
-----| www-int A 10.80.9.3
-----| fshare A 10.80.9.4
-----| sip A 10.80.9.5
-----| man-crit-apps A 10.81.22.33
...
```

Which of the following solutions, if implemented, would mitigate the risk of this issue reoccurring?

- A. Disabling DNS zone transfers
- B. Restricting DNS traffic to UDP/W
- C. Implementing DNS masking on internal servers
- D. Permitting only clients from internal networks to query DNS

Answer: A

Explanation:

The log snippet indicates a DNS AXFR (zone transfer) request, which can be exploited by attackers to gather detailed information about an internal network's infrastructure. Disabling DNS zone transfers is the best solution to mitigate this risk. Zone transfers should generally be restricted to authorized secondary DNS servers and not be publicly accessible, as they can reveal sensitive network information that facilitates lateral movement during an attack.

References:

? CompTIA SecurityX Study Guide: Discusses the importance of securing DNS configurations, including restricting zone transfers.

? NIST Special Publication 800-81, "Secure Domain Name System (DNS) Deployment Guide": Recommends restricting or disabling DNS zone transfers to prevent information leakage.

NEW QUESTION 125

A network engineer must ensure that always-on VPN access is enabled. Curt restricted to company assets. Which of the following best describes what the engineer needs to do?

- A. Generate device certificates using the specific template settings needed
- B. Modify signing certificates in order to support IKE version 2
- C. Create a wildcard certificate for connections from public networks
- D. Add the VPN hostname as a SAN entry on the root certificate

Answer: A

Explanation:

To ensure always-on VPN access is enabled and restricted to company assets, the network engineer needs to generate device certificates using the specific template settings required for the company's VPN solution. These certificates ensure that only authorized devices can establish a VPN connection.

Why Device Certificates are Necessary:

? Authentication: Device certificates authenticate company assets, ensuring that only authorized devices can access the VPN.

? Security: Certificates provide a higher level of security compared to username and password combinations, reducing the risk of unauthorized access.

? Compliance: Certificates help in meeting security policies and compliance requirements by ensuring that only managed devices can connect to the corporate network.

Other options do not provide the same level of control and security for always-on VPN access:

? B. Modify signing certificates for IKE version 2: While important for VPN protocols, it does not address device-specific authentication.

? C. Create a wildcard certificate: This is not suitable for device-specific authentication and could introduce security risks.

? D. Add the VPN hostname as a SAN entry: This is more related to certificate management and does not ensure device-specific authentication.

References:

? CompTIA SecurityX Study Guide

? "Device Certificates for VPN Access," Cisco Documentation

? NIST Special Publication 800-77, "Guide to IPsec VPNs"

NEW QUESTION 128

A systems engineer is configuring a system baseline for servers that will provide email services. As part of the architecture design, the engineer needs to improve performance of the systems by using an access vector cache, facilitating mandatory access control and protecting against:

- Unauthorized reading and modification of data and programs
- Bypassing application security mechanisms
- Privilege escalation
- interference with other processes

Which of the following is the most appropriate for the engineer to deploy?

- A. SELinux
- B. Privileged access management
- C. Self-encrypting disks
- D. NIPS

Answer: A

Explanation:

The most appropriate solution for the systems engineer to deploy is SELinux (Security- Enhanced Linux). Here's why:

? Mandatory Access Control (MAC): SELinux enforces MAC policies, ensuring that

only authorized users and processes can access specific resources. This helps in preventing unauthorized reading and modification of data and programs.

? Access Vector Cache: SELinux utilizes an access vector cache (AVC) to improve

performance. The AVC caches access decisions, reducing the need for repetitive policy lookups and thus improving system efficiency.

? Security Mechanisms: SELinux provides a robust framework to enforce security

policies and prevent bypassing of application security mechanisms. It controls access based on defined policies, ensuring that security measures are consistently applied.

? Privilege Escalation and Process Interference: SELinux limits the ability of

processes to escalate privileges and interfere with each other by enforcing strict access controls. This containment helps in isolating processes and minimizing the risk of privilege escalation attacks.

? References:

NEW QUESTION 129

During a gap assessment, an organization notes that OYOD usage is a significant risk. The organization implemented administrative policies prohibiting BYOD usage. However, the organization has not implemented technical controls to prevent the unauthorized use of BYOD assets when accessing the organization's resources. Which of the following

solutions should the organization implement to b» « reduce the risk of OYOD devices? (Select two).

- A. Cloud IAM to enforce the use of token based MFA
- B. Conditional access, to enforce user-to-device binding
- C. NAC, to enforce device configuration requirements
- D. PA
- E. to enforce local password policies
- F. SD-WA
- G. to enforce web content filtering through external proxies
- H. DLP, to enforce data protection capabilities

Answer: BC

Explanation:

To reduce the risk of unauthorized BYOD (Bring Your Own Device) usage, the organization should implement Conditional Access and Network Access Control (NAC). Why Conditional Access and NAC?

? Conditional Access:

? Network Access Control (NAC):

Other options, while useful, do not address the specific need to control and secure BYOD devices effectively:

? A. Cloud IAM to enforce token-based MFA: Enhances authentication security but does not control device compliance.

? D. PAM to enforce local password policies: Focuses on privileged account management, not BYOD control.

? E. SD-WAN to enforce web content filtering: Enhances network performance and security but does not enforce BYOD device compliance.

? F. DLP to enforce data protection capabilities: Protects data but does not control BYOD device access and compliance.

References:

? CompTIA SecurityX Study Guide

? "Conditional Access Policies," Microsoft Documentation

? "Network Access Control (NAC)," Cisco Documentation

NEW QUESTION 131

A company lined an email service provider called my-email.com to deliver company emails. The company stalled having several issues during the migration. A security engineer is troubleshooting and observes the following configuration snippet:

@	MX	10	email.company.com	45000
www	IN	CNAME	web01.company.com.	
email	IN	CNAME	srv01.company.com	
srv01	IN	A	192.168.1.10	
web01	IN	A	192.168.1.11	
@	IN	TXT	"v=dmarc include:company.com -all"	

Which of the following should the security engineer modify to fix the issue? (Select two).

- A. The email CNAME record must be changed to a type A record pointing to 192.168.111
- B. The TXT record must be Changed to "v=dmarc ip4:192.168.1.10 include:my-email.com - all"
- C. The srvo1 A record must be changed to a type CNAME record pointing to the email server
- D. The email CNAME record must be changed to a type A record pointing to 192.168.1.10
- E. The TXT record must be changed to "v=dkim ip4:192.168.1.11 include my-email.com - ell"
- F. The TXT record must be Changed to "v=dkim ip4:192.168.1.10 include:email-all"
- G. The srv01 A record must be changed to a type CNAME record pointing to the web01 server

Answer: BD

Explanation:

The security engineer should modify the following to fix the email migration issues:

? Email CNAME Record: The email CNAME record must be changed to a type A record pointing to 192.168.1.10. This is because CNAME records should not be used where an IP address (A record) is required. Changing it to an A record ensures direct pointing to the correct IP.

? TXT Record for DMARC: The TXT record must be changed to "v=dmarc ip4:192.168.1.10 include com -all". This ensures proper configuration of DMARC (Domain-based Message Authentication, Reporting & Conformance) to include the correct IP address and the email service provider domain.

NEW QUESTION 136

A company updates its cloud-based services by saving infrastructure code in a remote repository. The code is automatically deployed into the development environment every time the code is saved lo the repository The developers express concern that the deployment often fails, citing minor code issues and occasional security control check failures in the development environment Which of the following should a security engineer recommend to reduce the deployment failures? (Select two).

- A. Software composition analysis
- B. Pre-commit code linting
- C. Repository branch protection
- D. Automated regression testing
- E. Code submit authorization workflow
- F. Pipeline compliance scanning

Answer: BD

Explanation:

? B. Pre-commit code linting: Linting tools analyze code for syntax errors and adherence to coding standards before the code is committed to the repository. This helps catch minor code issues early in the development process, reducing the likelihood of deployment failures.

? D. Automated regression testing: Automated regression tests ensure that new code changes do not introduce bugs or regressions into the existing codebase. By running these tests automatically during the deployment process, developers can catch issues early and ensure the stability of the development environment.

Other options:

? A. Software composition analysis: This helps identify vulnerabilities in third-party components but does not directly address code quality or deployment failures.

? C. Repository branch protection: While this can help manage the code submission process, it does not directly prevent deployment failures caused by code issues or security check failures.

? E. Code submit authorization workflow: This manages who can submit code but does not address the quality of the code being submitted.

? F. Pipeline compliance scanning: This checks for compliance with security policies but does not address syntax or regression issues.

NEW QUESTION 140

A security architect is establishing requirements to design resilience in an enterprise system trial will be extended to other physical locations. The system must

- Be survivable to one environmental catastrophe
- Re recoverable within 24 hours of critical loss of availability
- Be resilient to active exploitation of one site-to-site VPN solution

- A. Load-balance connection attempts and data Ingress at internet gateways
- B. Allocate fully redundant and geographically distributed standby sites.
- C. Employ layering of routers from diverse vendors
- D. Lease space to establish cold sites throughout other countries
- E. Use orchestration to procure, provision, and transfer application workloads to cloudservices
- F. Implement full weekly backups to be stored off-site for each of the company's sites

Answer: B

Explanation:

To design resilience in an enterprise system that can survive environmental catastrophes, recover within 24 hours, and be resilient to active exploitation, the best strategy is to allocate fully redundant and geographically distributed standby sites. Here??s why:

? Geographical Redundancy: Having geographically distributed standby sites ensures that if one site is affected by an environmental catastrophe, the other sites can take over, providing continuity of operations.

? Full Redundancy: Fully redundant sites mean that all critical systems and data are replicated, enabling quick recovery in the event of a critical loss of availability.

? Resilience to Exploitation: Distributing resources across multiple sites reduces the risk of a single point of failure and increases resilience against targeted attacks.

? CompTIA Security+ Exam Objectives: These objectives cover key concepts in network security monitoring and incident response, providing guidelines on how to handle different types of security events.

? Security Operations Center (SOC) Best Practices: This resource outlines effective strategies for analyzing and responding to anomalous events within a SOC, including the use of blocklists, endpoint controls, and network configuration changes.

By accurately analyzing the nature of each IoC and applying the appropriate remediation measures, the organization can effectively mitigate potential security threats and maintain a robust security posture.

NEW QUESTION 146

A security analyst received a report that an internal web page is down after a company-wide update to the web browser. Given the following error message:

```
Your connection is not private.
```

```
Attackers might be trying to steal your information for www.internalwebsite.company.com.
```

```
NET::ERR_CERT_WEAK_SIGNATURE_ALGORITHM
```

Which of the following is the best way to fix this issue?

- A. Rewriting any legacy web functions
- B. Disabling all deprecated ciphers
- C. Blocking all non-essential ports
- D. Discontinuing the use of self-signed certificates

Answer: D

Explanation:

The error message "NET::ERR_CERT_WEAK_SIGNATURE_ALGORITHM" indicates that the web browser is rejecting the certificate because it uses a weak signature algorithm. This commonly happens with self-signed certificates, which often use outdated or insecure algorithms.

Why Discontinue Self-Signed Certificates?

? Security Compliance: Modern browsers enforce strict security standards and may reject certificates that do not comply with these standards.

? Trusted Certificates: Using certificates from a trusted Certificate Authority (CA) ensures compliance with security standards and is less likely to be flagged as insecure.

? Weak Signature Algorithm: Self-signed certificates might use weak algorithms like MD5 or SHA-1, which are considered insecure.

Other options do not address the specific cause of the certificate error:

? A. Rewriting legacy web functions: Does not address the certificate issue.

? B. Disabling deprecated ciphers: Useful for improving security but not related to the certificate error.

? C. Blocking non-essential ports: This is unrelated to the issue of certificate validation.

NEW QUESTION 151

.....

Thank You for Trying Our Product

We offer two products:

1st - We have Practice Tests Software with Actual Exam Questions

2nd - Questions and Answers in PDF Format

CAS-005 Practice Exam Features:

- * CAS-005 Questions and Answers Updated Frequently
- * CAS-005 Practice Questions Verified by Expert Senior Certified Staff
- * CAS-005 Most Realistic Questions that Guarantee you a Pass on Your FirstTry
- * CAS-005 Practice Test Questions in Multiple Choice Formats and Updatesfor 1 Year

100% Actual & Verified — Instant Download, Please Click
[Order The CAS-005 Practice Test Here](#)
